### 1 Basic Logic

### 1.1 Logical Framework

**Definition 1** Meta logic is the logic that used to formalize anthor logic

**Definition 2** Object logic is the logic that formalized from meta logic.

**Definition 3** Implementations of meta logics to represent and reason about object logics are called logical frameworks.

Annotation 4 上面提到的 implementations 实际上就是 languages,例如 Prolog 是这样的一个 language,它以 Horn clause 作为 meta logic. 你要实现的 object logic 可以通过这个 language 来进行 encoding,也就是所谓的 representating,同时还可以在 encoding 基础上进行 reasoning.

### 1.2 First Order Logic

Example 5 给定一个 statement:

"Every natural number is even or odd, but not both."

如果我们想要构造一个 system 去 accept 这个 statement,我们需要说明 natural number 是什么? even 和 odd 又是什么?如何描述 even 和 odd 是冲突的?这里引出这个 system 需要描述的三个重要部分: objects, their properties, and relations between them. 同时如何描述 every natural number?这里又涉及到了 quantifiter.

Annotation 6 我遵循描述一个 logical system, 首先定义里面的 terms, 再描述由这些 terms 构成的 formulas.

**Definition 7** A signature  $\sigma$  consist of constant symbols, function symbols and predicate symbols.

**Definition 8** Let  $\sigma$ -terms be a set of terms in first order logic, it defined by the follow inductive process:

- 1. Each variable  $x \in \sigma$ -terms.
- 2. Each constant symbol  $a \in \sigma$ , then  $a \in \sigma$ -terms.
- 3. If  $t_1, \dots, t_2 \in \sigma$ -terms and f is k-ary function symbol in  $\sigma$ , then  $f(t_1, \dots, t_k) \in \sigma$ -terms.

Let  $\mathcal{F}_{\sigma\text{-terms}}$  be a set of formulas in first order logic defined by follow inductive process:

- 1. Given terms  $t_1, \dots, t_k \in \sigma$ -terms and k-ary predicate symbol P then  $P(t_1, \dots, t_k)$  is a term.
- 2. All formulas relate to logical connective in propositional logic.
- 3. If  $F \in \mathcal{F}_{\sigma\text{-terms}}$  and x is a variable, then  $\forall x.F$  and  $\exists x.F$  are both in  $\mathcal{F}_{\sigma\text{-terms}}$ .

Annotation 9 在理解 propositional logic 的基础上,只要记住几个关键词 function, predicate, and quantifier 就足以刻画 first order logic.

**Definition 10** An atomic formula or atom in first-order logic is simply a predicate applied to a tuple of terms; that is, an atomic formula is a formula of the form  $P(t_1, \dots, t_n)$  for P a predicate, and the  $t_i$  terms.

Annotation 11 上面 first-order logic 里面 atoms 的定义可以好好想想. 我们可能之前印象中 atoms 只有 constants symbols, 现在多了一个 predicates.

**Definition 12** An atomic formula is a literal. and if a is an atomic formula, then  $\neg A$  is a literal.

**Definition 13** A finite set (possibly empty) of literals is called a clause and logical connectives. The empty clause is denoted by  $\Box$ .

Annotation 14 一个 clause 用什么 connective 取决于 context. 注意在 connective 为 disjunction 下的 empty clause 的真值可以总是被解释为 false, 这是因为当你考虑 clause  $\Box \lor C$  的时候,其中 C 是一个任意的 clause,那么  $\Box \lor C$  的真值实际上就是 C 的真值,这正好对应了 monoid ( $\{true, false\}, \lor$ ),在它里面 false is the neutral element,所谓 neutral element 就是说对这个 monoid 里面任意一个元素 a 都有  $false \lor a = a$ . 当 connective 为 conjunction 的时候,此时 empty clause 的真值总是可以被解释为 true,同理.

**Definition 15** A literal which contains no variables os called a ground literal.

## 1.3 Logical Formulas Means

**Definition 16** An interpretation of a logic formula F is the assignment of meanings to the symbols of F.

**Definition 17** If F is true under an interpretation  $\mathcal{I}$ , then  $\mathcal{I}$  is called a model of F

**Definition 18** A formula F is satisfiable if it has a model. It is unsatisfiable if it has no model.

**Definition 19** A formula F is valid if it is true under every interpretation.

Theorem 20 In classical logic:

F vaild  $\leftrightarrow \neg F$  unsatisfiable.

#### 1.4 Logical Formula Transformations

**Definition 21** A formula F is in prenex normal form if F is composed by a sequence of quantifier followed by a quantifier-free part(called the matrix)

**Example 22** 例如  $\forall x. \forall y. F(x,y)$ , 其中 F is quantifier-free, 那么这个就是一个 prenex normal form.

**Definition 23** A formula F is in negation normal form if all its negation are applied to atoms.

**Definition 24** A formula F is in conjunctive normal form (CNF) if it is a conjunction  $C_1 \wedge \cdots \wedge C_n$ , where  $C_1 \wedge \cdots \wedge C_n$ , where each  $C_i$  is disjunction of literals (i.e., atoms or negated atoms). Each  $C_i$  is called a clause.

**Definition 25** Let F be a formula in prenex normal form. The skolemization of F consists on replacing every existentially quantifiered variable y by a fresh function symbol  $f(x_1, \dots, x_n)$ , where  $x_1, \dots, x_n$  are the universally quantified variables occurring before y in the prefix of F. Additionally the existential quantification on y is removed. When there are no more existential quantifiers left the formula is skolemized.

**Example 26** 例如给定  $\exists x. \forall y. \exists z. p(x, y, z)$ , 它对应的 skolemization 为  $\forall y. p(c, x, f(y))$ .

# 1.5 Satisfiabitity of Logic Formulas

Annotation 27 现在只记录一下当下我自己的思考,未来会系统补充.

- 关于 connectives 对 sat 的影响:
  - 若  $F = F_1 \vee F_2$  and F is unsat, 那么需要  $F_1$  is unsat 和  $F_2$  is unsat.
  - 若  $F = F_1 \wedge F_2$  and F is unsat, 那么需要  $F_1$  is unsat 或者  $F_2$  is unsat.

可以看到它和 connectives 的关系好像是反过来了.

#### 1.6 Satisfiability of Sets of Formulas

**Definition 28** If v is a valuation, this is, a mapping from the atoms to the set  $\{t, f\}$ .

**Definition 29** [4] Let  $\Sigma$  denote a set of well-formed formulas and t a valuation. Define

$$\Sigma^{t} = \begin{cases} T & \text{if for each } \beta \in \Sigma, \beta^{t} = T \\ F & \text{otherwise} \end{cases}$$

When  $\Sigma^t = T$ , we say that t satisfies  $\Sigma$ . A set  $\Sigma$  is satisfiable iff there is some valuation t such that  $\Sigma^t = T$ .

**Definition 30** Let  $\Sigma$  be a set of formulas, and let  $\alpha$  be a formula, we say that

- 1.  $\alpha$  is a logical consequence of  $\Sigma$ , or
- 2.  $\Sigma$  (semantically) entails  $\alpha$ , or
- 3.  $\Sigma \models \alpha$ ,

if and only if for all truth valuations t, if  $\Sigma^t = T$  then also  $\alpha^t = T$ . We write  $\Sigma \nvDash \alpha$  for there exists a truth valuation t such that  $\Sigma^t = T$  and  $\alpha^t = F$ .

**Annotation 31** For example,  $\Sigma = \{p_1, p_2, \dots, p_n\}$  could be a set of premises and let  $\alpha$  could be the conclusion that we want to derive.

#### 1.7 Classic Propositional Modal Logic

**Definition 32** [8]Let  $\Sigma$  be a set of propositional letters or atomic propositions. The set  $F_P(\Sigma)$  of formulas of classical propositional modal logic is the smallest set with:

- 1. If  $A \in \Sigma$  is a propositional letter, then  $A \in F_P(\Sigma)$ ;
- 2. If  $\phi, \psi \in F_P(\Sigma)$ , then  $\neg \phi, (\phi \land \psi), (\phi \lor \psi), (\phi \to \psi) \in F_P(\Sigma)$ ;
- 3. If  $\phi \in F_P(\Sigma)$ , then  $(\Box \phi), (\Diamond \phi) \in F_P(\Sigma)$ .

**Definition 33** Let S be a system of modal logic, this is  $F_P(\Sigma)$  with a set of axioms and rules. If axioms and rules as follow

all propostional tautologies (P)
$$\Box(\phi \to \psi) \to (\Box \phi \to \Box \psi) \qquad \text{(Kripke axiom)}$$

$$\Box \phi \to \phi \qquad \qquad \text{(T)}$$

$$\Box \phi \to \Box \Box \phi \qquad \qquad \text{(4)}$$

$$\frac{\phi}{\psi} \qquad \qquad \text{(modus ponens)}$$

$$\frac{\phi}{\Box \phi} \qquad \qquad \text{(G\"{o}del)}$$

We call it modal logic S4.

Annotation 34 Kriple axiom 原本的形式应为

$$\Box \phi \wedge \Box (\phi \to \psi) \to \Box \psi$$

上面是它经常用的等价形式. Axiom T 是指若  $\phi$  is necessary, 那么  $\phi$  is true. Axiom 4 是指  $\phi$  is necessary, 那么命题" $\phi$  is necessary" is necessary, 有点别扭,举个形象的例子如果 box 是指某个人知道某件事,假设我知道  $A\ true$ ,那么我肯定知道我知道  $A\ true$ . 最后一个叫 Gödel translation,它将 intuitionistic logic 里面的 formulas 转换到 modal logic 里面.

**Definition 35** Let  $\mathcal{S}$  be a system of modal logic. For a formula  $\psi$  and a set of formulas  $\Phi$ , we write  $\Phi \vdash_{\mathcal{S}} \psi$  and say that  $\psi$  can be derived from  $\Phi$ (or is provable from  $\Phi$ ), iff there is a proof of  $\psi$  that uses only the formulas of  $\Phi$  and the axioms and proof rules of  $\mathcal{S}$ . That is, we define  $\Phi \vdash_{\mathcal{S}} \psi$  inductively as:

$$\Phi \vdash_{\mathcal{S}} \psi$$

iff  $\psi \in \Phi$  or there is an instance

$$\frac{\phi_1 \quad \cdots \quad \phi_n}{\psi}$$

of a proof rule of S with conclusion  $\psi$  and some number  $n \geq 0$  of premises such that for all  $i = 1, 2, \dots, n$ , the premises  $\phi_i$  is derivable, i.e:

$$\Phi \vdash_{\mathcal{S}} \phi_i$$

When the case n = 0 corresponds to axioms.

**Annotation 36** 现在以□表示 provable 的视角来看待前面提到的 axioms. 首先是

$$\Box(\phi \to \psi) \to (\Box \phi \to \Box \psi)$$
 (Kripke axiom)

若  $\phi \to \psi$  is provable 且  $\phi$  is provable, 那么则  $\psi$  is provable.

$$\Box \phi \to \phi$$
 (T)

若  $\phi$  is provable, 那么  $\phi$  should be true.

$$\Box \phi \to \Box \Box \phi$$
 (4)

若  $\phi$  is provable, 那么  $\phi$  should be provably provable, 也就是我们肯定知道存在一个 proof.

$$\frac{\phi}{\Box \phi}$$
 (Gödel)

若  $\phi$  is proven, 那么  $\phi$  should be provable.

**Definition 37** A Kripke frame  $(W, \rho)$  consists of a non-empty set W and a relation  $\rho \subseteq W \times W$  on worlds. The element of W are called possible worlds and  $\rho$  is called accessibility relation.

**Definition 38** A Kripke structure  $K = (W, \rho, v)$  consists of Kripke frame  $(W, \rho)$  and a mapping  $v : W \to \Sigma \to \{true, false\}$  that assigns truth-values to all the propositional letters in all worlds.

**Definition 39** Given a Kriple structure  $K = (W, \rho, v)$ , the interpretation  $\vDash$  of modal formulas in worlds s is defined as

- $K, s \models A \text{ iff } v(s)(A) = true;$
- $K, s \models \phi \land \psi$  iff  $K, s \models \phi$  and  $K, s \models \psi$ ;
- $K, s \vDash \phi \lor \psi$  iff  $K, s \vDash \phi$  or  $K, s \vDash \psi$ ;
- $K, s \vDash \neg \phi$  iff it is not the case that  $K, s \vDash \phi$ ;

- $K, s \vDash \Box \phi$  iff  $K, t \vDash \phi$  for all worlds t with  $s \rho t$ ;
- $K, s \models \Diamond \phi$  iff  $K, t \models \phi$  for some worlds t with  $s \rho t$ .

**Annotation 40** 最后两个关于 modality  $\square$  和  $\Diamond$  定义是最重要的,它们借助 accessible possible world 来 make sense. 可以通过它们的 nesting 形式来描述更长的路径即  $\square\square$ ,  $\Diamond\Diamond$ ,  $\square\Diamond$ .

**Definition 41** Given a Kripke structure  $K = (W, \rho, v)$ , formula  $\phi$  is vaild in K, written  $K \models \phi$ , iff  $K, s \models \phi$  for all worlds  $s \in W$ .

**Definition 42** (local consequence) Let  $\psi$  be a formula and  $\Phi$  a set of formulas. Then we write  $\Phi \vDash_l \psi$  if and only if, for each Kripke structure  $K = (W, \rho, v)$  and each world  $s \in W$ , we have  $K, s \vDash \Phi$  implies  $K, s \vDash \psi$ .

**Definition 43** (global consequence) Let  $\psi$  be a formula and  $\Phi$  a set of formulas. Then we write  $\Phi \vDash_g \psi$  if and only if, for each Kripke structure  $K = (W, \rho, v)$ , if for all world  $s \in W : K, s \vDash \Phi$ , then for all world  $s \in W : K, s \vDash \psi$ .

Annotation 44 local consequence 和 global consequence 的区别就是 assumption 是在某个 world 里面还是在所有的 worlds 里面.

**Definition 45** A formula  $\phi$  is vaild or a tautology, iff  $\emptyset \vDash_l \phi$ , which we write  $\vDash \phi$ . A set of formulas  $\Phi$  is called satisfiable, iff there is a Kripke structure K and a world s with  $K, s \vDash \Phi$ .

**Lemma 46** (local deduction theorem) For formulas  $\phi, \psi$  we have

$$\phi \vDash_l \psi \iff \vDash_l \phi \to \psi.$$

Annotation 47 (view of finite automata) 对于 Kripke frame 的第一反应应该是 finite automata, 但是对于一个给定的 finite automata 我们还需要一些额外的说明. 例如

每一个 state 里面存在一个 proposition,它表示这个 proposition is hold at this state,自然地 states 就变成了 possible worlds. state 现在可以接受多个输入  $\{0,1\}$ ,那么这里就表示我们有两个 relations  $\rho_0$  和  $\rho_1$ ,对应我们 需要两个 pair 来构建不同的 modality  $(\square_0, \lozenge_0)$  和  $(\square_1, \lozenge_1)$ ,它们都是用于描述某个 state 的 successor. 因此这里可以对应上一个 Kripke structure, 对上图我们可以列举几个 vaild formula.

$$K \models \neg \lozenge_0 F$$
 does not end with 0

$$K \vDash p \rightarrow \Diamond_0 p \quad p \text{ has a 1-loop}$$

$$K \vDash \Diamond_0 \ true$$
 never stuck with input 0

$$K \vDash \Diamond_1 \ true$$
 never stuck with input 1

再看一个稍微复杂一点

$$K \vDash F \to \Diamond_0(\neg \Diamond_0 F \land \neg \Diamond_1 F)$$

它意思如果某个状态  $\sigma$  下 F is hold, 那么  $\sigma$  accept 0 的 successors  $\{s_i\}$  中每个  $s_i$  的 successors 都无法 hold F, 显然这是成立的.

**Definition 48** A system S of proof rules and axioms of modal logic is sound iff, for all formulas  $\psi$  and all sets of formulas  $\Phi$ :

$$\Phi \vdash_S \psi \text{ implies } \Phi \vDash_q \psi$$

Annotation 49 上述 soundness 实际在建立关于 axiomatic modal logic 和 semantic modal logic 之间的一座桥, 这座桥需要每一个 axiom make sense.

**Lemma 50** Kripke axiom  $\Box(\phi \to \psi) \to (\Box \phi \to \Box \psi)$  is sound.

PROOF 首先给定任意一个 Kripke structure K. 我们需要证明

$$K, s \vDash \Box(\phi \to \psi) \to (\Box \phi \to \Box \psi).$$

因此假设其前提

$$K, s \vDash \Box(\phi \to \psi)$$

$$K, s \vDash \Box \phi$$

那么对应所有满足  $s\rho t$  的 successor t,都有

$$K, t \vDash \phi \rightarrow \psi$$

$$K, t \vDash \phi$$

自然地这里有  $K, t \models \psi$ ,于是  $K, s \models \Diamond \psi$ .

**Lemma 51** Gödel Rule  $\frac{\phi}{\Box \phi}$  is sound.

PROOF 注意这里的结论是建立在 global assumption 上的,即  $K, s \models \phi$  for any  $s \in W$ ,证明过程是显然的.  $\square$ 

**Lemma 52** A Kripke frame  $(W, \rho)$  is reflexive, that  $\rho$  is reflexive, if and only if  $K, s \vDash \Box q \to q$  for all Kripke structures  $K = (W, \rho, v)$ .

PROOF  $(\Rightarrow)$  若  $(W, \rho)$  is reflexive, 这是显然的.

( $\Leftarrow$ ) 若  $K, s \vDash \Box q \to q$  for all Kripke structures  $K = (W, \rho, v)$ . 假设存在一个 r such that  $(r, r) \notin \rho$ , 构造一个比较巧妙地 valuation v

$$v(s)(q) = \begin{cases} true & \text{if } r\rho s \\ false & \text{otherwise} \end{cases}$$

那么显然有  $K, r \models \Box q$ ,根据前提这里有  $K, r \models q$ ,而根据 valuation 这里就 r 存在一个 successor 是它自己,即 (r,r) 与假设矛盾.

**Lemma 53** A Kriple frame  $(W, \rho)$  is transitive, that  $\rho$  is transitive, if and only if  $K, s \models \Box q \rightarrow \Box \Box q$  for all Kripke structures  $K = (W, \rho, v)$ .

PROOF (⇒) 若  $(W, \rho)$  is transitive, 给定  $K, s \models \Box q$ , 对于 s 的任意一个 successor  $t(s\rho t)$  则有  $K, t \models p$ , 进一步对 t 的任意一个 successor  $r(t\rho r)$ , 考虑 transitive  $s\rho r$ , 那么有  $K, r \models p$ . 由于 t 和 r 的任意性,因此  $K, s \models \Box \Box p$ . (⇐) 若 Kriple frame 满足对任意的 valuation v 都有  $K, s \models \Box q \rightarrow \Box \Box q$ . 假设  $(W, \rho)$  不是 transitive,那么存在  $r_1, r_2, r_3 \in W$  such that  $r_1 \rho r_2, r_2 \rho r_3$  and  $(r_1, r_3) \notin \rho$ . 构造一个 valuation v

$$v(s)(q) = \begin{cases} true & \text{if } r_0 \rho s \\ false & \text{otherwise} \end{cases}$$

那么  $K, r_0 \models \Box q$ ,但是因为  $(r_0, r_3) \notin \rho$ ,因此  $K, r_0 \nvDash \Box \Box q$ ,和假设前提矛盾了.

Annotation 54 这座需要两边的支撑一样高,给定特定 axiomatic modal logic, 我们得到找到与之对应的 semantic modal logic, 我们的手法就是 sketch it from basic Kripke frame. 当我们尝试构造了一部分之后, 我们需要让其 make sense, 上述 lemma 利用 formula 来 characterize 是一个不错的选择.

**Definition 55** (characterization)Let C be a class of Kripke frames and  $\phi$  a formula in modal logic. Formula  $\phi$  characterizes C, if for every Kripke frame  $(W, \rho)$ :

$$(W, \rho) \in C$$
 iff for each  $v : K, s \models \phi$  holds for  $K = (W, \rho, v)$ .

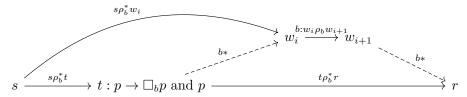

**Theorem 56** (soundness of S4)The Kriple proof rules for S4 are sound for the class of reflexive and transitive frames.

**Theorem 57** The conjunction of the following two multimodal formulas

$$\Box_a p \to (p \land \Box_a \Box_b p)$$
$$\Box_a (p \to \Box_b p) \to (p \to \Box_a p)$$

characterizest the class of all multimodal kripke frames  $(W, \rho_a, \rho_b)$  such that  $\rho_a$  is the reflxive, transitive closure of  $\rho_b$ .

PROOF ( $\Leftarrow$ ) 如果  $(W, \rho_a, \rho_b)$  is Kripke frame where  $\rho_a$  is the reflexive, transitive closure of  $\rho_b$ . 对于一个 formula 只要注意到  $\Box_a\Box_a p \to \Box_a\Box_b p$  即可,可以从需要考虑的 successors 数量来证明. 对于第二个 formula, 先给一个思考图

这里  $\rho_a = \rho_b^*$ . 这里证明手法是

$$\Box_a(p \to \Box_b p) \to \Box_a(p \to \Box_a p)$$
 and  $\Box_a(p \to \Box_a p) \to (p \to \Box_a p)$ 

最重要是证明第一个 implication,第二个 implication 是前面已经证明过的 reflexive. 对于第一个 implication 它 描述的是首先给出前提  $(1)\Box_a(p\to\Box_b p)$  即  $s\rho_b^*t$ . 然后我们想要将 t 中  $p\to\Box p$  扩展至  $p\to\Box_b^*p$ ,因此再给一个 假设前提 t holds p,我们来考察  $\Box_b^*p$  是否成立即  $t\rho_b^*r$ . 这里我们需要分解  $t\rho_b^*r$  使其为  $w_i\rho_b w_{i+1}$  for all i< n, 其中  $w_0=t$  和  $w_n=r$ . 利用数学归纳法证明  $K,w_i\vdash p$ ,这里就不详细描述了,和后面一个证明过程类似,但是说明几点:  $(1)s\rho_b^*w_i$  送来了  $p\to\Box_b p$  (2) 假设前提保证了  $K,w_i\models p$ . 因此  $K,w_{i+1}\models p$ .

(⇒) 如果  $(W, \rho_a, \rho_b)$  is Kripke frame such that above formulas are vaild in it for any valution v. 我们得证明  $\rho_a = \rho_b^*$ . 这种证明两个集合相等的手法,还是用两边证.

先证 $\rho_a \subseteq \rho_b^*$ . 取任意的  $(s,t) \in \rho_a$ ,我们得证明  $(s,t) \in \rho_b^*$ . 还是构造一个特殊的 valuation

$$v(w)(q) = \begin{cases} true & \text{if } (s, w) \in \rho_b^* \\ false & \text{otherwise} \end{cases}$$

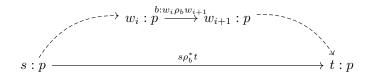

我们的思路是首先证明第二个 formula 的前提 (1)  $\square_a(p \to \square_b p)$ ,从而得到对应的 conclusion (2)  $(p \to \square_a p)$ ,由 给定的 v 结合  $\rho_b^*$  的 reflexive 性质,自然地有  $K, s \vDash p$ ,在使用一下 (2) 得到  $K, t \vDash p$ ,这样就有  $(s, t) \in \rho_b^*$ . 证明 (1) 思路是依然是假设前提: 给定  $s\rho_a w$  且  $K, w \vDash p$ ,实际上  $(s, w) \in \rho_b^*$ . 考虑下面的思考过程

$$s \xrightarrow{a:s\rho_b^* w'} w: p \xrightarrow{b:w\rho_b^* w'} w'$$

另外又给了一个 w' 满足  $w\rho_bw'$ ,再根据  $\rho_b^*$  的 transitive 得到  $s\rho_b^*w'$ ,从而  $K, w' \models p$ . 再证 $\rho_a \supseteq \rho_b^*$ . 取任意的  $(s,t) \in \rho_b^*$ ,我们要证明  $(s,t) \in \rho_a$ . 依然构造一个类似的 valuation

$$v(w)(q) = \begin{cases} true & \text{if } (s, w) \in \rho_a \\ false & \text{otherwise} \end{cases}$$

我们的思路: 由于我们构造地特别的 v 有  $K, s \models \Box_a p$ , 借助命题中的第一个 formula 得到对应的 conclusion (1)  $K, s \models p \land \Box_a \Box_b p$ . 考虑下面的思考过程

我们考虑将  $s\rho_b^*t$  拆开,设  $w_i\rho_bw_{i+1}$  for all i < n,其中  $w_0 = s$  和  $w_n = t$ ,这是可以做到的,考虑 closure 的构造过程. 再用一下数学归纳法证明  $K, w_i \models p$ ,在 i = 0 显然是成立的,假设  $w_i$  成立,那么根据 v 即有  $s\rho_aw_i$ ,再利用一下 (1) 可以得到  $K, w_i \models \Box_b p$ ,因此  $K, w_{i+1} \models p$ . 最终  $K, t \models p$ ,那么  $(s, t) \in \rho_a$ .

**Annotation 58** 回顾上面的证明手法,我们如果想要刻画两个 possible worlds 是否存在某种关系,例如  $(r,t) \in \rho$ ,我们可以额外借助一个 formula p 和 valuation v,仅使得所有 w 满足  $r\rho w$  都 hold p. 这样如果我们能利用额外和 p 相关的条件间接证明 t holds p,那么就可以证明  $s \to t$ . 我们应该意识到 relations 是 Kripke frame 固有的性质,与 valuation 无关因此这里我们可以任意的定义它.

#### 2 Natural Deduction

**Remark 59** Natural deduction is a kind of proof calculus in which logical reasoning is expressed by inference rules closely related to the "natural" way of reasoning.

### 2.1 Judgments and Propositions

**Definition 60** A *judgment* is somthing we may know, this is, an object of knowledge. A judgment is *evident* if we in fact know it.

**Annotation 61** "A is false" (see classical logic), "A is true at time t" (see temporal logic), "A is necessarily true" or "A is possibly true" (see modal logic), "the program M has type " (see programming languages and type theory), "A is achievable from the available resources" (see linear logic).

#### 2.2 Introduction and Elimination

**Definition 62** Inference rules that introduce a logical connective is the conclusion are known as *introduction rules*. i.e., to conclude "A and B true" for propositions A and B, one requires evidence for "A true" and B true. As an inference rule:

$$\frac{A \ true \quad B \ true}{A \land B \ true} \land I$$

Here  $\wedge I$  stands for "conjunction introduction".

Annotation 63 实际上面的 inference rule 的 general form 应该是

$$\frac{A \ prog \quad B \ prog \quad A \ true \quad B \ true}{A \wedge B \ true} \ \wedge I$$

这里才能帮助后面的⊨ make sense.

**Definition 64** Inference rules that describe how to deconstruct information about a compound proposition into information about its consitiuents are elimination rules. i.e., from  $A \wedge B$  true, we can conclude A true and B true:

$$\frac{A \wedge B \ true}{A \ true} \ \wedge E_L \qquad \frac{A \wedge B \ true}{B \ true} \ \wedge E_R$$

**Annotation 65** The meaning of conjunction is determinded by its *verifications*.

#### 2.3 Hypothetical Derivations

**Definition 66** A hypothetical judgment is  $J_1, \dots, J_n \vdash J$ , where judgments  $J_1, \dots, J_n$  are unproved assumptions, and the judgment J is the conclusion. A hypothetical deduction (derivation) for  $J_1, \dots, J_n \vdash J$  has the form

$$J_1 \quad \cdots \quad J_n$$

$$\vdots$$

$$I$$

which means J is derivable from  $J_1, \dots, J_n$ .

**Annotation 67** 上面的  $J_1, \dots, J_2$  都可以替换成关于  $J_i$  的一个 hypothetical derivation.

**Definition 68** In the natural deduction calculus, an assumption is discharged when the conclusion of an inference does not depend on it, although one of the premises of the inference does[1].

Annotation 69 Once the appropriate rules have been completed, these are known as discharged assumptions, and are not included in the pool of assumptions on which the conclusion of the rule depends[3].

Annotation 70 hypothetical derivation 要求最后的 conclusion 依赖的 poof of assumptions 不是空的.

Theorem 71 Deduction theorem

$$T, P \vdash Q \iff T \vdash P \to Q$$

.

Annotation 72 在 deduction theorem 中我们注意到第一个 hypothetical judgment 里面的 antecedent Q 被去掉了,在第二个 hypothetical judgment 的 succedent 里面作为一个 implication 的 antecedent 出现了,这里我们就可以说 assumption Q is discharged,即现在的 conclusion 已经不依赖它了. 那么我们是如何构造 deduction theorem 里面的 implication 的呢?下面接着看

**Definition 73** (implication) If B is true under the assumption that A is true, formly written  $A \supset B$ . The corresponde introduction and elimination rule as follow

$$\begin{array}{c} \overline{A \; true} \;\;^{u} \\ \vdots \\ \underline{B \; true} \\ A \supset B \; true} \supset I^{u} \end{array} \quad \begin{array}{c} A \supset B \; true \quad A \; true \\ B \; true \end{array} \supset E \end{array}$$

Annotation 74 Why indexed u In the introduction rule, the antecedent named u is discharged in the conclusion. This is a mechanism for delimiting the scope of the hypothesis: its sole reason for existence is to establish " $B \ true$ "; it cannot be used for any other purpose, and in particular, it cannot be used below the introduction.

上面这段话出自 natural deduction 的 wiki,这个 uscope 了 assumption A true 的开端,因为  $A \supset B$  并不依赖 A true,它描述只是 if A true then B true. 同时最后的 introduction rule 会将这个 assumption A true discharged 掉,表示 scope 在这里已经结束了. 而 implication rule 会将上述 derivation 直接总结得到一个结论,即

$$A \vdash B \Rightarrow \cdot \vdash A \rightarrow B$$
.

**Example 75** Considering the following proof of  $A \supset (B \supset (A \land B))$ 

$$\frac{\overline{A\ true}\ ^{u}\ \overline{B\ true}}{A \land B\ true} \land I \atop I^{w} \atop \overline{A \supset (B \supset (A \land B))\ true}\ I^{u}.$$

这整个 derivation 不是 hypothetical 的,因为两个 assumptions A true 和 B true 都已经被 discharged,因此它实际上一个 complete proof!

**Definition 76** (disjunction) The elimination rule for disjunction:

both assumption u, w are discharged at the disjunction elimination rule.

**Definition 77** The falsehood elimination rule:

$$\frac{\perp true}{C true} \perp E$$

**Annotation 78** falsehood elimination 的意义在哪? 首先你应该主要到一个特殊等价命题  $A\lor \bot = A$ ,从  $\lor$  的 introduction rule 来看这意味  $\bot$   $true \vdash A$  true,由于 A 是任意的,因此我们得到了  $\bot$   $true \vdash C$  true.

### 2.4 Harmony

**Definition 79** Local soundness shows that the elimination rules are not strong: no matter how we apply eliminations rules to the result of an introduction we cannot gain any new information.

**Definition 80** Local completeness shows that the elimination rules are not weak: there is always a way to apply elimination rules so that we can reconstitute a proof of the original proposition from the tresults by apply intruduction ruls.

Annotation 81 local soundness 告诉你通过 elimination 得到的东西不会比你已经知道的东西强 (not strong), 而 local completeness 告诉你可以利用通过 elimination 得到的东西来构造你原本你已经知道的东西 (not weak).

**Definition 82** Given two deduction of same judgment, we use the notion

$$\begin{array}{c} \mathcal{D} & \mathcal{D}' \\ A \ true \Longrightarrow_R A \ true \end{array}$$

for the local reduction of a deduction  $\mathcal{D}$  to another deduction D' of same judgement A true. Similarly, we have local expansion

$$\begin{array}{c} \mathcal{D}' & \mathcal{D} \\ A \ true \Longrightarrow_E A \ true \end{array}$$

**Definition 83** (substitution Principle) If

$$\begin{array}{c} \overline{A \ true} \ u \\ \mathcal{E} \\ C \ true \end{array}$$

is a hypothetical proof of C true under the undischarged hypothesis A true labelled u, and

$$\mathop{\mathcal{D}}_{A\ true}$$

is a proof of A true then

$$\begin{array}{c} \frac{\mathcal{D}}{A \ true} \ u \\ \mathcal{E} \\ C \ true \end{array}$$

is our notation for substituting  $\mathcal{D}$  for all uses of the hypothesis labelled u in  $\mathcal{E}$ . This deduction, also sometime written as  $[\mathcal{D}/u]\mathcal{E}$  no longer depends on u.

Example 84 If given a elimination rule of disjunction as follow

$$\frac{A \vee B \ true}{A \ true} \ \lor E_L$$

The rule a little bit stronger, since we would not be able to reduce

$$\frac{\frac{B\ true}{A \lor B\ true}}{A\ true} \ \bigvee_{L}$$

As u can see it's not local soundness.

#### 2.5 Verifications and Uses

**Definition 85** a verification should be a proof that only analyzes the constituents of a proposition.

Annotation 86 [9] 在 natural deduction 中由于 local reduction 的存在,可能会让一个证明过程变得非常的冗余,例如在证明 conjunction commutativity

其中左上角的 local reduction 显然是冗余的. 这样对于谈论某个具体 proposition 的 proof 时就会出现问题, 因为 the shape of proof is not decidable. 同时我们也希望未来能够设计出一个 tool 用于 deviates proofs automatically, 也就是 search proof automatically. 因此从 natural deduction 上诞生了一个新的 calculus, 它会在 syntax level 上来施加一些限制, 借此限制 the shape of proof. 最后我们将证明这个 calculus 引入的 restrictions 不会产生 side-effect.

**Definition 87** Writing  $A \uparrow$  for the judgment "A has a verification". Naturally, this should mean that A is true, and that the evidence for that has a special form.

**Definition 88** Writing  $A \downarrow$  for the judgment "A may be used".  $A \downarrow$  should be the case when either A true is a hypothesis, or A is deduced from a hypothesis via elimination rules.

Annotation 89 我觉得下述两种理解方式更为明确易懂

- $A \uparrow$  denotes that we are searching for a vertication of A;
- $A \downarrow$  denotes that we are allowed to use A.

Annotation 90 上述两个 definitions 里面隐藏着非常重要但有点不正式的结论:If A has a vertification then A true, 反之依然. 后面我们将形式化地证明它们.

**Definition 91** For conjunction.

$$\frac{A \uparrow \quad B \uparrow}{A \land B \uparrow} \land I \qquad \frac{A \land B \downarrow}{A \downarrow} \land E_L \qquad \frac{A \land B \downarrow}{B \downarrow} \land E_R$$

**Definition 92** For implication

$$\begin{array}{ccc} \overline{A\downarrow} & u \\ \vdots \\ \overline{B\uparrow} \\ \overline{A\supset B\uparrow} & \supset^u & \begin{array}{ccc} \overline{A\supset B\downarrow} & A\uparrow \\ \overline{B\downarrow} & \end{array} \supset E \end{array}$$

**Annotation 93** (why implication) In order to have a verification of  $A \supset B$ , we need a proof of B and we are given an assumption A to work with. Therefore, we will need a verification of B and we are allowed to use A.

When using an implication statement in a proof, we need to show that the antecedent holds, so we need a verification of it. Only then we are allowed to use the consequent.

#### Example 94

$$\frac{(A\supset A)\supset B~? \quad \frac{A~?}{A~?}}{\frac{B~?}{((A\supset A)\supset B)\supset B~\uparrow}}$$

#### Example 95

$$\frac{\overline{A \wedge B \ true}}{A \ true} \overset{u}{\wedge} E_L \\ \overline{(A \wedge B) \supset A \ true} \supset I^u$$

那么它对应上 verification 和 use

$$\frac{ \frac{A \wedge B \downarrow}{A \downarrow} \wedge E_L}{(A \wedge B) \supset A ?} \supset I^u$$

一切都非常奇怪,这个 verification 和 use 到底是怎样对应 truth? 从前面两个例子都可以清晰地感觉到一个阻力,即

$$A\downarrow ???? A\uparrow$$

就是当我们在 use A 的时候,实际上存在一个 A has a verification.

#### **Definition 96** For disjunction

$$\frac{A\uparrow}{A\lor B\uparrow}\lor I_L \qquad \frac{B\uparrow}{A\lor B\uparrow}\lor I_R \quad \frac{A\lor B\downarrow}{C\uparrow} \quad \stackrel{\vdots}{C\uparrow} \quad \stackrel{\vdots}{C\uparrow} \lor E^{u,w}$$

**Definition 97** For truth and falsehood.

$$\frac{\bot}{\top\uparrow} \; \top I \qquad \frac{\bot \downarrow}{C\uparrow} \; \bot \, E$$

**Annotation 98**  $\perp \downarrow$  signifies a contradiction from our hypotheses.

**Annotation 99** the elimination rule of disjunction and falsehood 里面出现 conclusion  $C \uparrow$  也很奇怪,为什么不是  $C \downarrow$ ?

**Definition 100** For atomic propositions.

$$\frac{P\downarrow}{P\uparrow}\downarrow\uparrow$$
.

**Annotation 101** 当引入上述的 arrow switch 之后我们可以回答前面的种种问题了. 首先是 example 94, 假设其中的 A, B 都是 atomic proposition,则

$$\frac{\frac{\overline{A} \downarrow u}{\overline{A} \uparrow \downarrow \uparrow}}{\underline{(A \supset A) \supset B \downarrow} w \quad \frac{\overline{A} \downarrow \uparrow}{\overline{A \supset A} \uparrow} \supset I^{u}}$$

$$\frac{B \downarrow}{B \uparrow} \downarrow \uparrow$$

$$\overline{((A \supset A) \supset B) \supset B \uparrow} \supset I^{w}$$

同时如果将 implication emilination 的 premise 换成  $A\downarrow$ , 在找  $A\supset A\downarrow$  的 proof 时就被卡住了. example 95类似. 那么有一个很自然的问题这个 arrow switch 能不能推广到任意的 propositions 上呢? 本质上是没有问题的,例如

$$\frac{A \supset A \downarrow \qquad \frac{\overline{A} \downarrow}{A \uparrow} \qquad \downarrow \uparrow}{\frac{A \downarrow}{A \uparrow} \downarrow \uparrow} \\
\frac{A \downarrow}{\overline{A} \supset A \uparrow} \supset I^{u}$$

但是这样的语法又会使得 proof search space 变大,并不符合我们的初衷,因此我们只将 arrow switch 放在的了 atomic proposition 上,这样做的后果你也可以看到,需要将 connectives 都展开.

再来思考另外一种 arrow switch

$$\frac{F\downarrow}{F\uparrow}\uparrow\downarrow$$

这个人在本质上也是没有问题的,当我们有一个关于 F 的 verification,我们当然可以 use it. 但是引入它同样会造成我们的 proof search space,就像 classical logic 中的 tautologies,我们可以在任何 proof 中使用它,但是有时候是没有意义的. 同在 emilinotation rule of disjunction and falsehood 中的 conclusion 中我们都是使用的 verification,而不是 use,也是为了防止后续使得我们的 proof 变得复杂.

Theorem 102 (Global Soundness) If 
$$A \uparrow$$
 and  $\dot{C} \uparrow$  then  $C \uparrow$ 

**Annotation 103** Global Soundness 意味着如果 if the verification formula of C under the verification formula A, 那么在 C 中使用 A, 并不会得到任何其他 new informations.

**Theorem 104** (Global Completeness) If  $A \downarrow$ , then  $A \uparrow$ .

#### 2.6 Notational Definition

**Definition 106** A notational definition gives the meaning of the general form of a proposition in terms of another proposition whose meaning has already been defined.

**Example 107** We can define logical equivalence, written  $A \equiv B$  as

$$(A \supset B) \land (B \supset A).$$

**Example 108** We can define negation  $\neg A$  as

$$\neg A = (A \supset \bot) \Longrightarrow \neg A \quad \neg I$$

We also can give the introduction rule of falsehood.

$$\frac{\neg A \quad A}{\bot} \perp I$$

so  $\perp$  actually means any contradictions. moreover double negation is coming.

**Annotation 109** notational definition 可以看做用已有的东西构造出一些东西. 与之对应的是我们可以直接符号化的给出某个新的定义, 称之为 symbolic definition.

#### 2.7 Soundness and Completeness of Native Natural Deduction

**Definition 110** [5]Soundness of natural deduction means that the conclusion of proof is always a logical consequence of the premises. That is

If 
$$\Sigma \vdash \alpha$$
, then  $\Sigma \vDash \alpha$ .

**Definition 111 Completeness** of natural deduction means that all logical consequences in propositional logic are provable in natural deduction. That is,

If 
$$\Sigma \vDash \alpha$$
, then  $\Sigma \vdash \alpha$ .

**Annotation 112** 其中  $\Sigma \vdash \alpha$ ,表示存在一个以  $\Sigma$  作为 premise 得到 conclusion 为  $\alpha$  的 proof. 而  $\Sigma \vDash \alpha$ ,就 考虑两端的 proposition 加上 truth-falsehood 了,即如  $\Sigma^t = True$  则有  $\alpha^t = True$ .

对于 soundness 的证明,我们需要根据  $\alpha$  的结构来做归纳,而后再考虑赋予其 true/false 来考虑. 这里记录一下对于结构归纳它是怎样对应一般归纳法命题 P(n) 结构上,这里的 n 应该对应  $\alpha$  的 bottom-up derivation 里面的 maximum depth of line.

而对于 completeness 的证明,相对来说会复杂一点. 我们需要下面 3 个 lemma. 有一个疑问不引入 negation 是不是还说明不了 completeness?

**Lemma 113** If  $\Sigma = \{\alpha_0, \alpha_1, \dots, \alpha_n\}$  and  $\Sigma \vDash \beta$ , then

$$\emptyset \vDash (\alpha_0 \to (\alpha_1 \to (\cdots \to (\alpha_n \to \beta) \cdots)).$$

**Annotation 114** Deduction theorem 体现的淋漓尽致,将  $\beta$  完美转换成了一个 tautology.

**Lemma 115** For any well-form formula  $\gamma$  containing atoms  $p_1, p_2, \cdots, p_n$  and any valuation t, we have

- 1. If  $\gamma^t = True$  then  $\widehat{p}_1, \widehat{p}_2, \cdots, \widehat{p}_n \vdash \gamma$ ;
- 2. If  $\gamma^t = False$  then  $\widehat{p}_1, \widehat{p}_2, \cdots, \widehat{p}_n \vdash \neg \gamma$ ;

where defines  $\hat{p}_i$  as follow

$$\widehat{p}_i = \begin{cases} p_i & \text{if } p_i^t = True \\ \neg p_i & \text{if } p_i^t = False \end{cases}$$

**Example 116** 若  $\gamma = p \rightarrow q$ ,我们可以构造一个真值表

p	q	$p \rightarrow q$	Claim
T	T	T	$p, q \vdash p \to q$
T	F	F	$  p, \neg q \vdash \neg (p \to q)  $
F	T	T	$\neg p, q \vdash p \to q$
F	F	T	$\neg p, \neg q \vdash p \rightarrow q$

那么上面的 claims 是怎么来的呢? 我们可以来分别证明, 对于第一行

$$\frac{\overline{p \; true} \; u \quad q \; true}{\frac{q \; true}{p \rightarrow q \; true} \; u}$$

感觉有点奇怪,这里需要用到 vars inference rule,这里相对于对  $q \vdash p \rightarrow q$  的 weaken premise. 对于第二行

$$\frac{p \to q \ true}{q} \quad \begin{array}{ccc} u & p \ true \\ \hline q & & \neg q \ true \\ \hline \hline \frac{\bot}{\neg (p \to q) \ true} \ u
\end{array}$$

对于第三行

$$\frac{p \ true}{\frac{\bot}{q \ true}} u \quad \neg p \ true}{\frac{\bot}{q \ true}} u$$

对于第四行,和第三行类似.可以看的出来这个 lemma 非常深刻,只要将 atoms 调整为在当前 valuation 下都是 true 的命题,结论再对应调整,就可以构造一个对应的 proof.

**Lemma 117** For any well-formed formula  $\gamma$ , if  $\emptyset \vDash \gamma$ , then  $\emptyset \vdash \gamma$ .

Annotation 118 Lemma 117—句话概况就是 tautologies are provable. 其证明过程可以用 Lemma 115来说明. 现在  $\gamma$  是一个 tautology,那么对于所有的 valuation 都有  $\gamma^t = true$ ,这有什么用呢? 这里还需要引入另外一种 tautology  $p \vee \neg p$ ,配合 emilination rule of vee,即

这里需要考虑有  $2^n$  个 cases,每一个对应一种 valuation,又因为  $\gamma$  是 tautology,因此最后的 conclusion 也都 是  $\gamma$ .

**Lemma 119** If  $\emptyset \vdash (\alpha_0 \to (\alpha_1 \to (\cdots \to (\alpha_n \to \beta) \cdots))$ , then  $\{\alpha_0, \alpha_1, \cdots, \alpha_n\} \vdash \beta$ , that is,  $\Sigma \vdash \beta$ .

#### 2.8 Derived Rules of Inference

Example 120

$$\frac{A\supset B\ true\quad B\supset C\ true}{A\supset C\ true}$$

is a derived rule of inference. Its derivation is the following:

Annotation 121 关于 derivation 的推导这里有一些 strategies 在里面

- 使用 introduction rule 从下至上,即我们想要什么;
- 使用 elimination rule 从上至下,即我们知道什么.

Example 122 Modus tollens(这玩意不就是逆否命题)

$$\frac{A \to B \quad \neg B}{\neg A} MT$$
.

### 2.9 Curry-Howard Conrrespondence

**Definition 123** Curry-Howard correspondence is between the natural deduction and simply-typed  $\lambda$ -calculus at three levels

- propositions are types;
- proofs are programs; and
- simplification of proofs is evaluation of programs.

That is

Types	Propositions
Unit types (1)	Truth $(\top)$
$\frac{1}{1}$ Product type (×)	Conjunction $(\land)$
Union type (+)	Disjunction (V)
Function type $(\rightarrow)$	Implication $(\supset)$
Void types (0)	False $(\bot)$

Every typing rule has a correspondence with a deduction rule.

**Example 124** The typing derivation of the term  $\lambda a$ .  $\lambda b$ .  $\langle a,b \rangle$  can be seen as a deduction tree proving  $A \supset B \supset A \land B$ .

$$\frac{\frac{a:A\in\Gamma}{\Gamma\vdash a:A}\ var\ \frac{b:B\in\Gamma}{\Gamma\vdash b:B}\ var}{\frac{\Gamma\vdash a:A}{\Gamma\vdash b:B}\ var} \underbrace{\frac{A\ true}{\Gamma\vdash \lambda y:B.\ \langle a,y\rangle:B\to A\times B}\ abs}_{\frac{\Gamma\vdash \lambda x:A.\ \lambda y:B.\ \langle x,y\rangle:A\to B\to A\times B}\ abs} \underbrace{\frac{A\ true}{B\ true}\ \stackrel{u}{\to} \frac{B\ true}{A\to B\ true}}_{\frac{B\to A\wedge B\ true}{A\to B\to A\wedge B\ true}} \stackrel{v}{\to} I^w}_{\frac{B\to A\wedge B\ true}{A\to B\to A\wedge B\ true}} \supset I^w$$

Annotation 125 从上面例子中看的出来, the inference rule of natural deduction 缺点什么, 我也可以给原本每个 inference rule 都加上 the annotation for proof terms. [6] 那么这里 M:A 有两种解释:

- 1. M is proof term for proposition A;
- 2. M is a program of type A.

这样解释 Curry-Howard ismorphism 或许方便一点. 让 proof terms make sense: 我们有"if M:A then A true",反过来"if A true then M:A". 例如我们可以将 the proof term of  $A \land B$  true 看做一个 pair 包含两个 subterm,一个关于 A true 和另一个关于 B true.

$$\frac{M:A \quad N:B}{\langle M,N\rangle:A\wedge B} \ \land I$$

那么 the elimination rule of conjunction 对应一个 natural projection.

$$\frac{M:A\wedge B}{\pi_1M:A} \wedge E_L \quad \frac{M:A\wedge B}{\pi_2M:B} \wedge E_R$$

**Example 126** 通过 Curry-Howard isomorphism 我们可以将我们想要证明的 judgment 转换到 type system 中, 你会看到非常的便利! 例如

$$(A \supset (B \land C)) \supset (A \supset B) \land (A \supset C) true$$

等价于

$$\lambda x. \ \langle \lambda y. \ \pi_1(x \ y), \lambda y. \ \pi_2(x \ y) \rangle : (A \to B \times C) \to (A \to B) \times (A \to C)$$

一个 implication 被转换成了对应的 abstraction, 此时我们肯定会想如果给一个 false proposition 是不是就转不了? 例如

$$(A \supset B) \supset (B \supset A)$$

显然我们无法在现有 type system 构造出一个合理的 abstraction 使得  $(A \to B) \to (B \to A)$ .

迎面走来的问题是: 给定一个 proposition true, 是否有其他的 term with type 和它对应呢?显然是有的,

$$\lambda z. \ \lambda x. \ \langle \lambda y. \ \pi_1(x \ y), \lambda y. \ \pi_2(x \ y) \rangle z'$$

那这是不是违反 Curry-Howard isomorphsim 了呢?其实并不是,这里的对应是指 proof terms 和 deduction of proposition true, 显然 deduction 变了,对应的 proof terms 也要变.

Annotation 127 Curry-Howard isomorphism 建立在 ND 和 STLC 之间似乎看起来局限性很强,但是它是非常重要的第一步,是我们以另外一种视角来看待问题的方法,例如 well-type term is normalizing,那么也意味 well-formed formula is derivable. 之后 researcher 渐渐地发现了其他的 logics 也可以找到与之对应的 programming language,直到现在这仍然是一个 active research field.

#### 2.10 Quantifier

Annotation 128 natural deduction 很自然地建立在 propositional logic 上,现在要把 quantifier 加到里面,我们就得面向 first order logic 了,这里需要引入 terms 和 variables 来为后面 construction 做准备.另外还得必要引入关于 term 的 properties,这里我们给它一个合适的名字叫做 type,即 type of term,为什么要引入这个它呢?因为你可以想象我们经常在谈及 quantified statement 的时候,例如"every natural number is even or odd",这里谈论的对象是 natural number,那么这个 natural number 实际上就是这里 term 的 type.

**Definition 129** A formula  $\forall x.A$  hold if and only if for every term a chosen, the proposition A[a/x] hold, where the proposition means all occurrences of x in A replaced by a.

**Definition 130** The introduction rule of universal quantifier is defined as follow:

$$\begin{array}{c} a:\tau\\ \vdots\\ A[a/x]\ true\\ \forall x.A\ true \end{array} \forall I^a$$

where term a is called an *eigenvariable* and its shoule be fresh, meaning that it has not occurred anywhere else in the proof.

**Definition 131** The emilination rule of universal quantifier is defined as follow:

$$\frac{\forall x. A \ true \quad t : \tau}{A[t/x] \ true} \ \forall E$$

where term t should not be any bound variables in A.

**Definition 132** A formula  $\exists x.A$  holds if and only if for some term t, A[t/x] holds.

**Definition 133** The introduction rule of existential quantifier is defined as follow:

$$\frac{A[t/x]\ true \quad t:\tau}{\exists x.A\ true}\ \exists I$$

where term t should not be any bound variables in A.

**Definition 134** The emilination rule of existential quantifier is defined as follow:

$$\begin{array}{ccc} \overline{a:\tau} & \overline{A[a/x] \ true} \\ \underline{\exists x.A \ true} & C \ true \\ \hline C \ true \end{array} \exists E^{a,u}$$

where variable a should be fresh.

Theorem 135 The rules for quantifier is local soundness and completeness

PROOF The local reduction and local expansion of universal quantifier as follow:

$$\begin{array}{ccc} \mathcal{D} & & \frac{\forall x.A \ true & \overline{a} : \overline{\tau}}{A[a/x] \ true} \\ \forall x.A \ true & \Rightarrow_E & \frac{A[a/x] \ true}{\forall x.A \ true} \ \forall I^a \end{array}$$

The local reduction and local expansion of existential quantifier as follow:

$$\mathcal{D}_{\exists x. A \ true} \Rightarrow_{E} \frac{\mathcal{D}}{\exists x. A \ true} \frac{\overline{a : \tau} \quad \overline{A[a/x] \ true}}{\exists x. A \ true} \exists E^{a,u}$$

Annotation 136 注意到 local expansion of existential quantifier 并不是以一个 introduction rule 结尾的,这和我预想的有些不太一样.

Annotation 137 Quantifiers corresponse dependent types.

# 3 More Delicate

# 3.1 Natural Deduction in Sequent Nation

 $\textbf{Definition 138} \ \ \textbf{A} \ \ \textbf{sequent is a pariticular form of hypothetical judgement}$ 

$$A_1, \cdots, A_n \vdash C$$
.

where  $A_1, \dots, A_n$  and C are well-defined formulas.

**Definition 139** The correspondence between natural deduction and natural deduction in sequent nation.

$\frac{A \ true  B \ true}{A \wedge B \ true} \ \wedge I$	$\frac{\Gamma \vdash A  \Gamma \vdash B}{\Gamma \vdash A \land B} \land I$
$\frac{A \wedge B \ true}{A \ true} \wedge E_1  \frac{A \wedge B \ true}{B \ true} \wedge E_2$	$ \frac{\Gamma \vdash A \land B}{\Gamma \vdash A} \land E_1  \frac{\Gamma \vdash A \land B}{\Gamma \vdash B} \land E_2 $
$\frac{A \ true}{A \lor B \ true} \lor I_1  \frac{B \ true}{A \lor B \ true} \lor I_2$	$\frac{\Gamma \vdash A}{\Gamma \vdash A \lor B} \lor I_1  \frac{\Gamma \vdash B}{\Gamma \vdash A \lor B} \lor I_2$
$\overline{A \ true}^{\ u} \ \overline{B \ true}^{\ w}$	
$\begin{array}{ c c c c c c }\hline A \lor B \ true & C \ true & C \ true \\\hline \hline C \ true & \\\hline \end{array} \lor E^{u,w}$	$\begin{array}{ c c c c c c c c c c c c c c c c c c c$
$\overline{A \ true}^{\ u}$	
$\frac{\vdots}{A \supset B \ true} \supset I^u$	$\frac{\Gamma, A \vdash B}{\Gamma \vdash A \supset B} \supset I$
$\frac{A \supset B \ true  A \ true}{B \ true} \supset E$	$\frac{\Gamma \vdash A \supset B  \Gamma \vdash A}{\Gamma \vdash B} \supset E$
${\top true} \ \top I$	$\Gamma \vdash \top$ $\top I$
$\frac{\perp}{C} \frac{true}{true} \perp E$	$\frac{\Gamma \vdash \bot}{\Gamma \vdash C} \perp E$
Hypothesis discharging	$\overline{\Gamma,A \vdash A} \ hyp$
Substitution	$\frac{\Gamma, A \vdash C  \Gamma \vdash A}{\Gamma \vdash C} \ subst$

Annotation 140 (detail of correspondence) 其中  $\Gamma$  是一个 set of formulas, 它可以是 empty set. 思考上述 sequent 形式下的 natural deduction, 我们应该用 bottom-up 的视角来观察. 试想我们在没有 additional assumptions 证明一个 formulas, 在最开始  $\Gamma$  应该是 empty 的,随着我们不断 apply 上述规则过程中将不断的填充  $\Gamma$ . 那么什么时候证明算接结束了呢? 在 natural deduction 中我们从下往上使用 introduction rules,并添加相应的 assumptions,再从上往下使用 emilination rules,直到它们在中途相遇,这时候我们的证明就结束了,当证明结束的时候,此时所有的 assumptions 都应该被 discharge 了,这个操作对应到 sequent 形式下就是上述 hyp rule,在利用 sequent 构造 proof 的时候,总是以 hyp rule 结束的.

显然 sequent 提供了一种收集 assumptions 的方式,使得 assumptions 和需要证明的 formula 总是在一个 level, 一旦某个 assumption 建立之后,以此往后的证明过程中这个 assumption 都是 visible 的.

Example 141 A proof in sequent form.

$$\frac{A\supset B, (A\land C) \vdash A\supset B}{A\supset B, (A\land C) \vdash B} \stackrel{hyp}{\longrightarrow} \frac{A\supset B, (A\land C) \vdash A\land C}{A\supset B, (A\land C) \vdash A} \stackrel{hyp}{\supset E} \frac{A\supset B, (A\land C) \vdash A\land C}{A\supset B, (A\land C) \vdash C} \stackrel{hyp}{\land E_2} \frac{A\supset B, (A\land C) \vdash C}{A\supset B, (A\land C) \vdash C} \land I$$

$$\frac{A\supset B, (A\land C) \vdash (B\land C)}{A\supset B\vdash (A\land C)\supset (B\land C)} \supset I$$

$$\vdash (A\supset B)\supset ((A\land C)\supset (B\land C)) \supset I$$

**Definition 142** We say a rule is admissible if all proofs using the rule can be transformed into proofs that do not use the rule.

**Lemma 143** The *subst* rule is admissible.

PROOF 我们可以将其替换为等价的形式

### 3.2 Sequent Calculus

Definition 144 A sequent is a pariticular form of hypothetical judgement

$$A_1 \ left, \cdots, A_n \ left \vdash C \ right.$$

where A left corresponds to a proposition that can be used  $(A \downarrow)$  and C right corresponds to a proposition we have to verify  $(C \uparrow)$ . The right rules decompose C in analogy with introduction rules from the perspective of "bottom-up", while the left rule decompose one of the hypotheses, in analogy with elimination rules, but "upside-down".

**Definition 145** 引入上述 sequent 及其 inferences 是为了正式地说明 proof search, 即从 conclusion 到 premises 的 derivations.

**Definition 146** The initial rule

$$\overline{\Gamma, P \; left \vdash P \; right} \; \; init$$

where P is atomic proposition.

**Definition 147** The left rules and right rules

$egin{array}{c} rac{\Gamma, A \wedge B \; left, A \; left dash C \; right}{\Gamma, A \wedge B \; left dash C \; right} \; \wedge L_1 \ rac{\Gamma, A \wedge B \; left, B \; left dash C \; right}{\Gamma, A \wedge B \; left dash C \; right} \; \wedge L_2 \end{array}$	$ \frac{\Gamma \vdash A \ right  \Gamma \vdash B \ right}{\Gamma \vdash A \land B \ right} \ \land R $
$\frac{\Gamma, A \supset B \ left \vdash A \ right  \Gamma, A \supset B \ left, B \ left \vdash C \ right}{\Gamma, A \supset B \ left \vdash C \ right} \supset L$	$\frac{\Gamma, A \; left \vdash B \; right}{\Gamma \vdash A \; left \supset B \; right} \supset R$
$\frac{\Gamma, A \vee B \ left, A \ left \vdash C \ right  \Gamma, A \vee B \ left, B \ left \vdash C \ right}{\Gamma, A \vee B \ left \vdash C \ right} \ \lor L$	$\frac{A \ right}{\Gamma \vdash A \lor B \ right} \lor R_1$ $\frac{B \ right}{\Gamma \vdash A \lor B \ right} \lor R_2$
	${\Gamma \vdash \top \ right} \ \top R$
$rac{\Gamma, \perp \ left}{C \ right} \perp L$	

**Annotation 148** The above rules we can use  $\Gamma \Rightarrow A$  instead of them.

Annotation 149 这里 frank 给出的 left rules 怪怪的,因为 conclusion 里面的 assumptions 依然出现在了 primises 里面,这让人很奇怪,虽然不影响其正确性. frank 对此的意见是这只是一种 weakening 操作,同时他想表达一个"monotonicity of hypotheses" 的概念:在 bottom-up 形式下的 proof 中一旦建立某个 assumption,那么它在后续的构造过程中同样 available.

我的感觉是 left rules 应该和 right rules 一样, right rules 在 simplify conclusion, 而 left rules 也应该去 simplify hypotheses. 这里 simplify 是指去掉 formula 里面存在的 connectives.

**Example 150** The proof in sequent calculus.

$$\frac{\overline{A \supset B, (A \land C), A \Rightarrow A}}{A \supset B, (A \land C) \Rightarrow A} \stackrel{init}{\land L_1} \frac{A \supset B, (A \land C), B \Rightarrow B}{A \supset B, (A \land C) \Rightarrow B} \stackrel{init}{\supset L} \frac{\overline{A \supset B, (A \land C), C \Rightarrow C}}{A \supset B, (A \land C) \Rightarrow C} \stackrel{init}{\land L_2} \frac{A \supset B, (A \land C) \Rightarrow C}{\land A \supset B, (A \land C) \Rightarrow C} \land R$$

$$\frac{\overline{A \supset B, (A \land C) \Rightarrow (B \land C)}}{\overline{A \supset B \Rightarrow (A \land C) \supset (B \land C)}} \supset R$$

$$\Rightarrow (A \supset B) \supset ((A \land C) \supset (B \land C)) \supset R$$

**Theorem 151** (from verifications to sequent calculus) Given hypotheses  $\Gamma = (A_1 \uparrow, \dots, A_n \uparrow)$ , it corresponds to  $\widehat{\Gamma} = (A_1 left, \dots, A_n left)$ . Then we have

- 1. If  $\Gamma \vdash C \uparrow$  then  $\widehat{\Gamma} \vdash C \text{ right}$ ;
- 2. If  $\Gamma \vdash A \downarrow$  and  $\widehat{\Gamma}$ ,  $A \ left \vdash C \ right$  then  $\widehat{\Gamma} \vdash C \ right$ .

PROOF 这里需要对  $\Gamma \vdash C \uparrow$  和  $\Gamma \vdash A \downarrow$  做 mutual induction. 记录几个 representative cases.

Case 1 若

$$\frac{\Gamma, C_1 \downarrow \vdash C_2 \uparrow}{\Gamma \vdash C_1 \supset C_2 \uparrow} \supset I$$

则

- (1)  $\widehat{\Gamma}$ ,  $C_1$  left  $\vdash C_2$  right hyp.1 from premise1
- (2)  $\widehat{\Gamma} \vdash C_1 \supset C_2 \ right \longrightarrow R.$  (1)

Case 2 若

$$\frac{\Gamma \vdash P \downarrow}{\Gamma \vdash P \uparrow} \downarrow \uparrow$$

则

- (1)  $\widehat{\Gamma}$ , P left  $\vdash$  P right init
- (2)  $\widehat{\Gamma} \vdash P \ right$  hyp.2 from premise1

Case 3 若

$$\frac{\Gamma \vdash A_1 \supset A_2 \downarrow \quad \Gamma \vdash A_1 \uparrow}{\Gamma \vdash A_2 \downarrow} \supset E$$

则

- (1)  $\widehat{\Gamma}$ ,  $A_2$  left  $\vdash C$  right assumption
- (2)  $\widehat{\Gamma}, A_1 \supset A_2 \ left, A_2 \ left \vdash C \ right \ weakening(1)$
- (3)  $\widehat{\Gamma} \vdash A_2 \ right$  hyp.1 from premise1
- (4)  $\widehat{\Gamma}, A_1 \supset A_2 \ left \vdash A_2 \ right$  weakening(3)
- (5)  $\widehat{\Gamma}, A_1 \supset A_2 \ left \vdash C \ right \supset L(2)(4)$
- (6)  $\widehat{\Gamma} \vdash C \ right$  hyp.1 from premise2

Case 4 若

$$\overline{\Gamma', A \downarrow \vdash A \downarrow} \ hyp$$

则

- (1)  $\widehat{\Gamma}$ ,  $A \ left$ ,  $A \ left \vdash C \ right$  assumption
- (2)  $\widehat{\Gamma}$ ,  $A \ left \vdash C \ right$  contraction(1)

Annotation 152 注意这里的 hypotheses 是两个部分,因为 verification calculus 的 elimintation rule 存在,会导致 use 同样出现在左端. 实际这里缺一个过程,应该像 ND in Seq 那样,我们也应该对 verificatio calculus 也做一个 sequent 形式的变换.

**Theorem 153** (substitution of uses) If  $\Gamma \vdash A \downarrow$  then

- 1. if  $\Gamma, A \downarrow \vdash B \downarrow$  then  $\Gamma \vdash B \downarrow$ , and
- 2. if  $\Gamma, A \downarrow \vdash C \uparrow$  then  $\Gamma \vdash C \uparrow$ ,

PROOF 这里需要对  $\Gamma, A \downarrow \vdash B \downarrow$  和  $\Gamma, A \downarrow \vdash C \uparrow$  做 mutual induction. 还是列举几个代表性的 cases.

Case 1 Base case

$$\overline{\Gamma \vdash \top \uparrow} \ \top I$$

根据假设  $\Gamma, A \downarrow \vdash \top \uparrow$ , 这里显然有  $\Gamma, \vdash \top \uparrow$ .

Case 2 若

$$\frac{\Gamma' \vdash C \supset B \downarrow \quad \Gamma' \vdash C \uparrow}{\Gamma' \vdash B \downarrow} \supset E$$

其中  $\Gamma' = (\Gamma, A \downarrow)$ . 那么

(1) 
$$\Gamma \vdash A \downarrow$$
 assumption

(2) 
$$\Gamma \vdash C \supset B \downarrow \text{ hyp.1}$$

(3) 
$$\Gamma \vdash C \uparrow$$
 hyp.2

(4) 
$$\Gamma \vdash B \downarrow \supset E(3)(4)$$

**Theorem 154** (from sequent calculus to verifications) If  $\widehat{\Gamma} \vdash C$  right then  $\Gamma \vdash C \uparrow$ .

PROOF 注意这里有个 abuse symbol 了,结合前面的 theorem,可能会想成我们构造了一个 isomorphism,其实不是这样的,我仅仅讨论从一边到另一边,并不是 composition! 这里依然对  $\hat{\Gamma} \vdash C$  right 做 structure induction. 列举几个代表性 cases.

Case 1 Base case

$$\frac{}{\widehat{\Gamma} \vdash \top \ right} \ \top R$$

显然有  $\Gamma \vdash \top \uparrow$ .

Case 2 若

$$\frac{\widehat{\Gamma}, A \; left \vdash B \; right}{\widehat{\Gamma} \vdash A \supset B \; right} \supset R$$

则

(1) 
$$\Gamma, A \uparrow \vdash B \uparrow \text{ hyp}$$

(2) 
$$\Gamma \vdash A \supset B \uparrow \supset I(1)$$

Case 3 若

$$\frac{\widehat{\Gamma}, A \supset B \ left \vdash A \ right \quad \widehat{\Gamma}, A \supset B \ left, B \ left \vdash C \ right}{\widehat{\Gamma}, A \supset B \ left \vdash C \ right} \supset L$$

则

(1) 
$$\Gamma, A \supset B \downarrow \vdash A \uparrow$$
 hyp

(2) 
$$\Gamma, A \supset B \downarrow \vdash A \supset B \downarrow hyp rule$$

(3) 
$$\Gamma, A \supset B \downarrow \vdash B \downarrow \qquad \supset E(1)(2)$$

(4) 
$$\Gamma, A \supset B \downarrow, B \downarrow \vdash C \uparrow \text{ hyp}$$

(n) 
$$\Gamma, A \supset B \vdash C \uparrow$$
 subst(153)

**Definition 155** (another of substitution) The rule of cut

$$\frac{\Gamma \vdash A \ right \quad \Gamma, A \ left \vdash C \ right}{\Gamma \vdash C \ right} \ cut$$

**Annotation 156** 注意 cut rule 是在用 the vertification of A 去替换 the use of A, 这和前面 substitution of uses 是不太一样的.

**Theorem 157** (admissibility of cut) If  $\Gamma \vdash A \ right$  and  $\Gamma, A \ left \vdash C \ right$  then  $\Gamma \vdash C \ right$ .

PROOF 证明 cut rule 是个技术活. 我们要做一个 nested structure induction. 首先给定 cut rule 的 shape

$$\frac{\mathcal{D}}{\Gamma \Rightarrow A} \quad \begin{array}{c} \mathcal{E} \\ \Gamma, A \Rightarrow C \end{array} cut$$

这里我们要对 triple  $(C, \mathcal{D}, \mathcal{E})$  做归纳. 有三种 base cases:

- 1. 若  $\mathcal{E}$  是 *init* rule. 这里两个地方可以 apply *init* rule. 此时 A 为 atomic.
  - (a) 若 A 不同于 C. 那么这里可以马上知道  $A \in \Gamma$ ,因此可以 emilinate 掉 cut.

$$\frac{\Gamma \stackrel{\mathcal{D}}{\Rightarrow} C \quad \overline{\Gamma, C \Rightarrow A}}{\Gamma \Rightarrow A} \stackrel{init}{cut} \leadsto \overline{\Gamma \Rightarrow A} \quad init$$

(b) 若 C = A. 那么这里显然可以直接用  $\mathcal{D}$  得到  $\Gamma \Rightarrow A$ .

$$\frac{\Gamma \Rightarrow A}{\Gamma \Rightarrow A} \frac{\overline{\Gamma, A \Rightarrow A}}{\cot} \inf_{cut} \mathcal{D}_{cut} \rightarrow \Lambda$$

2. 若  $\mathcal{D}$  是 *init* rule. 此时 C 是 atomic, 那么可以知道  $C \in \Gamma$ , 因此  $\Gamma', C, C \Rightarrow A$ , 再用一下 contraction 就有  $\Gamma \Rightarrow A$ , 因此这里可以用  $\mathcal{E}$  作为 proof derivation.

$$\frac{\Gamma \Rightarrow C \quad init \quad \Gamma, C \Rightarrow A}{\Gamma \Rightarrow A} \quad cut \underset{\leadsto}{\sim} \Gamma \Rightarrow A.$$

3. 若 C 是 atomic. 此时有可能  $\mathcal D$  和  $\mathcal E$  都不是 init rule, 此时我们需要一个 lemma 160 来使得它们变成前面 两种情况.

那么我们怎么来用这三个 base case, 这里就展示一下 nested induction 是咋 worked. 首先我们给定一个命题 cut(F,l,r): 如果 l 是一个关于  $\Gamma \Rightarrow F$  的 cut-free proof, r 是一个关于  $\Gamma,F \Rightarrow C$  的 cut-free proof, 那么我们可以构造一个关于  $\Gamma \Rightarrow C$  的 cut-free proof. 来正式开始我的 induction.

- [11]BASE CASE(1): ∀l.∀r.cut(atom, l, r)
  对应前面的 base case(3).
- Induction step(1): to show  $\forall l. \forall r. cut(F+1, l, r)$

IH(1):  $\forall l. \forall r. cut(F, l, r)$ 

The proof proceeds by induction on l:

- BASE CASE(2):  $\forall l. \forall r. cut(F+1, init, r)$  对应前面的 base case(2).
- Induction step(2): to show  $\forall l. \forall r.cut(F+1, l+1, r)$

IH(2):  $\forall l. \forall r. cut(F+1, l, r)$ 

The proof proceeds by induction on r:

- 1. Base case(3):  $\forall l. \forall r. cut(F+1, l+1, init)$
- 2. Induction step(3): to show  $\forall l. \forall r. cut(F+1, l+1, r+1)$

 $IH(3): \ \forall l. \forall r. cut(F+1, l+1, r)$ 

Now we show this by cases. As a bleow example:

$$\frac{\Gamma \xrightarrow{\mathcal{D}} A \quad \Gamma \xrightarrow{\mathcal{E}} B}{\Gamma \Rightarrow A \land B} \quad \frac{\Gamma, A \land B, A \Rightarrow C}{\Gamma, A \land B \Rightarrow C} \land L_1}{\Gamma \Rightarrow C}$$

$$\mathcal{D} + \text{ weakening } \mathcal{E} + \text{ weakening } \\ \frac{\Gamma, A \Rightarrow A}{\Gamma, A \Rightarrow B} \wedge R \qquad \frac{\Gamma, A \Rightarrow B}{\Gamma, A \land B, A \Rightarrow C} \\ \frac{\Gamma \Rightarrow A}{\Gamma \Rightarrow C} \qquad Cut$$

on the upper-most cut, we apply IH(3), since F+1 and l+1 are unchanged, but right branch is now r, which is smaller. and on the lower cut, we apply IH(1), since we have F as the cut-formula.  $\Box$ 

**Definition 158** We call rank deduction the rewriting operation that premutes the cut rule over other rules in a proof.

Annotation 159 "premutes it up" 是啥意思呢? 就是指某个 cut rule" 往上移", 例如

$$\frac{\overline{\Gamma, A \wedge B, A \Rightarrow A}}{\Gamma, A \wedge B \Rightarrow A} \stackrel{init}{\wedge L_1} \quad \begin{array}{c} \mathcal{E} \\ \Gamma, A \wedge B \Rightarrow C \end{array} \quad cut$$

$$\frac{\Gamma, A \land B, A \Rightarrow A}{\Gamma, A \land B, A \Rightarrow A} \begin{array}{c} init & \mathcal{E} + \text{ weakening} \\ \Gamma, A \land B, A, A \Rightarrow C \\ \hline \frac{F, A \land B, A \Rightarrow C}{\Gamma, A \land B \Rightarrow C} \land L_1 \end{array} cut$$

此时 cup 拥有了 smaller left branch, 这其中为我们后续的 nested induction hypothesis 提供了途径. 再来看一个例子

$$\frac{\Gamma \Rightarrow A \quad \Gamma \Rightarrow B}{\Gamma \Rightarrow A \land B} \quad \frac{\Gamma, A \land B, A \Rightarrow C}{\Gamma, A \land B \Rightarrow C} \land L_1$$

$$\Gamma \Rightarrow C \quad cut$$

$$\mathcal{D} + \text{ weakening } \mathcal{E} + \text{ weakening } \\ \frac{\Gamma, A \Rightarrow A}{\Gamma, A \Rightarrow B} \wedge R \quad \frac{\Gamma, A \land B, A \Rightarrow C}{\Gamma, A \land B, A \Rightarrow C} \text{ cut } \\ \frac{\mathcal{D}}{\Gamma \Rightarrow A} \quad \frac{\Gamma, A \Rightarrow C}{\Gamma \Rightarrow C} \text{ cut}$$

此时 cut rule 中的两个 premises 中的 cut formula 都是被 apply 了相应的 rules, 这种 shape 的 cut 我称为principal cases,它和第一个例子不太相同.此时下面这个 cup 拥有了 smaller left branch,而上面这个 cup 拥有了 smaller right branch.

**Lemma 160** The *cut* rule permutes up all other rules that do not operate on the cut formula.

PROOF 换句话说就是对于任意的 *cut* rule, 我们都可以重排它的 primises, 把 cut 放到 right place. 那么这里分别要对它的 primises 应用 sequent calculus 的规则,两个 primises 就是 20cases. td □

Annotation 161 引入 cut rule 不利于做 proof search.

**Definition 162** (generalization of *init* rule) The rule of identity

$$\overline{\Gamma, A \; left \vdash A \; right} \; id$$

**Theorem 163** (admissibility of identity)  $\Gamma$ ,  $A \ left \vdash A \ right$  fir arbitrary propositions A and contexts  $\Gamma$ .

PROOF 对 A 做 structure induction. 列举几个代表性的 cases.

Case 1 若 A = P, 根据 init rule 显然有  $\Gamma$ , A left  $\vdash$  A right.

 $Case\ 2$  若  $A = B \supset C$ . 则

(1) 
$$\Gamma, B \ left \vdash B \ right$$
 hyp

(2) 
$$\Gamma, B \supset C \ left, B \ left \vdash B \ right$$
 weakening

(3) 
$$\Gamma$$
,  $C$  left  $\vdash C$  right hyp

(4) 
$$\Gamma, B \supset C \ left, B \ left, C \ left \vdash C \ right$$
 weakning

(5) 
$$\Gamma, B \supset C \ left, B \ left \vdash C \ right \supset L(2)(4)$$

(6) 
$$\Gamma, B \supset C \ left \vdash B \supset C \ right$$
  $\supset R(5)$ 

 $Case \ 3 \ 若 \ A = B \wedge C.$  则

(1) 
$$\Gamma, B \wedge B, B \Rightarrow B$$
 hyp + weakening

(2) 
$$\Gamma, B \wedge C \Rightarrow C \qquad \wedge L_1(1)$$

(3) 
$$\Gamma, B \wedge C, C \Rightarrow C$$
 hyp + weakening

(4) 
$$\Gamma, B \wedge C \Rightarrow B \qquad \wedge L_2(3)$$

(5) 
$$\Gamma, B \wedge C \Rightarrow B \wedge C \wedge R(2)(4)$$

**Theorem 164** (from natural deduction to sequent calculus) If  $\Gamma \vdash A$  true then  $\widehat{\Gamma} \vdash A$  right.

PROOF 依然对  $\Gamma \vdash A$  true 做 structure induction. 列举几种代表性 cases.

Case 1 若

$$\frac{A \ true}{\Gamma', A \ true} \ hyp$$

此时  $\Gamma = (\Gamma', A \ true)$ , 根据  $identity \ rule(162)$  有  $\widehat{\Gamma}, A \ left \vdash A \ right$ .

Case 2 若

$$\frac{\Gamma, B \; true \vdash C \; true}{\Gamma \vdash B \supset C \; true} \supset I$$

则

(1) 
$$\widehat{\Gamma}$$
,  $A \ left \vdash B \ right$  hyp

(2) 
$$\widehat{\Gamma} \vdash A \supset B \ right \supset R(1)$$

Case 3 若

$$\frac{\Gamma \vdash C \supset B \ true \quad \Gamma \vdash C \ true}{\Gamma \vdash B \ true} \supset E$$

则

- (1)  $\widehat{\Gamma} \vdash C \supset B \ right$  hyp
- (2)  $\widehat{\Gamma} \vdash C \ right$  hyp
- (3)  $\widehat{\Gamma}, C \supset B \ left, C \ left \vdash C \ right$  identity
- (4)  $\widehat{\Gamma}, C \supset B \ left, C \ left, B \ left \vdash B \ right \ identity$
- (6)  $\widehat{\Gamma}, C \ left \vdash B \ right$  cut(1)(5)
- (7)  $\widehat{\Gamma} \vdash B \ right$  cut(2)(6)

**Theorem 165** (truth and verification)  $A true \text{ iff } A \uparrow$ .

PROOF (⇒) 从  $A \updownarrow$  到 A true 是比较显然的,直接将所有的 arrow 都换成 true 即可,对于 arrow switch  $\downarrow \uparrow$ ,此时 premise 和 conclusion 都是相同,因此这里可以在转换中去掉.

(⇐) 这里就需要多出中间一步. 利用 Theorem 164 将 ·  $\vdash$  A true 转换到 ·  $\vdash$  A right; 再利用 Theorem 154 将 ·  $\vdash$  A right 转换到 ·  $\vdash$  A  $\uparrow$ .

Annotation 166 How everything is related

Natural Deduction

 $\equiv$ 

ND in sequent nation

Sequent Calculus(with cut, identity and weakening)

1

Sequent Calculus

≡

Verification Calculus

where  $\equiv$  means the systems are equivalent,  $\updownarrow$  means the systems are sound and complete each other, and  $\updownarrow$  means the system are shown to be equivalent by showing the rules cut, identity and weakening are admissible.

## 3.3 Validity

**Definition 167** A valid if  $\bullet \vdash A$  true where  $\bullet$  is emphasizing that there are no truth hypotheses(different from  $\cdot$  that represents empty collection of hypotheses), and we call  $\bullet \vdash A$  true is categorical judgement. Written  $\Delta A$  for reflecting the notion of validity as a proposition.

**Annotation 168** 其中  $\Box A$  表示一个 proposition claimed A is vaild, 因此  $\Box A$  true 表示这个 proposition 成立. 那么关于它的 introduction rule 是什么?很自然地由 A valid 的 definition 有

$$\frac{\bullet \vdash A \ true}{\Gamma \vdash \Box A \ true} \ \Box I$$

那么它的 elimination rule 又是什么呢?第一次尝试

$$\frac{\Gamma \vdash \Box A \ true}{\bullet \vdash A \ true} \ \Box E$$

看起来是 local soundness, 通过它得到的 infos 还行. 但是实际上有问题

$$\frac{\square A \ true \vdash \square A \ true}{\bullet \vdash A \ true} \ \square E$$

这等于我们可以 no assumption 推出所有 proposition 都是 valid, 因此这个 elimination rule 有点太强了. 那么我们考虑让它弱一点,第二次尝试

$$\frac{\Gamma \vdash \Box A \ true}{\Gamma \vdash A \ true} \ \Box E$$

这里确实是 local soundness, 但却不是 local completeness

$$\frac{\Gamma \vdash \Box A \ true}{\Gamma \vdash A \ true} \ \begin{array}{c} \Box E \\ ? \end{array}$$

我们得改变一下思路,如果 A vaild,那么其他 premise 包含 A vaild 的 judgement那么实际上都是可以去掉 A vaild,但也仅仅局限以此,这才是 emilination 故事的主线.

**Definition 169** Then general judgement form

$$\underbrace{u_1 :: B_1 \ vaild, \cdots, u_k :: B_k \ vaild}_{\Lambda}; \underbrace{x_1 : A_1 \ true, \cdots, x_n : A_n \ true}_{\Gamma} \vdash C \ true$$

**Definition 170** The introduction rule and elimination rule of A vaild as follow

$$\frac{\Delta; \bullet \vdash A \; true}{\Delta; \Gamma \vdash \Box A \; true} \; \Box I \qquad \frac{\Delta; \Gamma \vdash \Box A \; true \quad \Delta, u :: A \; vaild; \Gamma \vdash C \; true}{\Delta; \Gamma \vdash C \; true} \; \Box E$$

Theorem 171 Local soundness and local completeness of above introduction and elimination rule are held

**Annotation 172** 可以看到 emilination rule 变成了 substitution, 而不是从单纯从本身要得到什么, 后面会看见更多这样的东西.

**Example 173** Proof of  $\cdot$ ;  $\cdot \vdash \Box A \supset A$ .

$$\frac{\vdots x : \Box A \; true \vdash \Box A \; true}{ \vdots x : \Box A \; true} \; \frac{x}{u :: A \; vaild; x : \Box A \; true \vdash A \; true} \; \frac{u}{\Box E^u} \\ \frac{\vdots x : \Box A \; true}{\vdots : \vdash (\Box A \supset A) \; true} \supset I^x$$

# 3.4 Box is Powerful

**Definition 174**  $\square$  is  $\square$ .

**Definition 175** A term box M means M is a quated source expression such that there are not any free variables x.

**Definition 176** And  $\Box A$  is necessity modality.

## 3.5 Possibility

**Definition 177** We use  $\Diamond A$  for possibility modality.

Annotation 178  $\lozenge A$  就是一个 claim A is possible 的命题. 通常在 classic modal logic 里面我们定义 A is possible if its negation is not necessary, that is  $\lozenge A = \neg \Box \neg A$ . 但是这种手法在现在我们讨论的 intuitionistic logic 无法奏效,我们希望的是有一个直观的 introduction rule 来得到它,也就是我们需要一些 explicit evidences,一开始就它的 negation 那显然是做不到的.

**Definition 179** [7] The definition of possiblity.

$$\frac{\Delta, \Gamma \vdash A \ true}{\Delta, \Gamma \vdash A \ poss} \ poss$$

**Definition 180** The introduction and emilination rule of possiblity.

$$\frac{\Delta;\Gamma \vdash A\ poss}{\Delta;\Gamma \vdash \Diamond A\ true}\ \Diamond I \qquad \frac{\Delta;\Gamma \vdash \Diamond A\ true\ \Delta;x:A\ true \vdash C\ poss}{\Delta;\Gamma \vdash C\ poss}\ \Diamond E$$

**Annotation 181** 注意这里的 emilination rule 里面的第二个 premise 中的 hypothesis 只有 A true, 即我们 under assumption A true, we conclude C poss.

Theorem 182 Local soundness and completeness are held.

Annotation 183 td; 对上述 inference rule 的理解.

**Example 184** Proof of  $\Box(A \supset B) \supset \Diamond A \supset \Diamond B$ .

# 4 Proof Searching

# 4.1 Simplification

Annotation 185 目的是去掉 sequent calculus 里面 the duplication of main formula. 为了区分 simplified sequent, 我们用 → 代替 ⇒

**Definition 186** [12]Simplified sequent calculus defined as follow

$\frac{\Gamma, A, B \to C}{\Gamma, A \land B \to C} \land L$	$\begin{array}{ c c c c }\hline \Gamma \to A & \Gamma \to B \\\hline \Gamma \to A \land B & \land R \\\hline \end{array}$
$\frac{\Gamma, A \to C  \Gamma, B \to C}{\Gamma, A \lor B \to C} \lor L$	$\frac{A}{\Gamma \to A \lor B} \lor R_1$ $\frac{B}{\Gamma \to A \lor B} \lor R_2$
$\frac{\Gamma, A \supset B \to A  \Gamma, B \to C}{\Gamma, A \supset B \to C} \supset L$	$\frac{\Gamma, A \to B}{\Gamma \to A \supset B} \supset R$
	${\Gamma \to \top} \ \top R$
$\overline{\Gamma, \bot \to C} \perp L$	
$\overline{\Gamma, P  o P}$	

Annotation 187 为什么 implication emilination 的 left premise 中的 main formual 没有去掉? 这是值得探讨的问题, right premise 能去掉因为

$$\frac{\overline{\Gamma,A\supset B\Rightarrow A\supset B}\ id}{\Gamma,B\Rightarrow C}\ cut$$

同时更加底层的原因是  $\vdash B \supset (A \supset B)$ . 而你此时思考  $\Gamma, A \supset B \supset A$  时,应当思考是否存在一个关于 A 的 proof 里面需要用到  $A \supset B$ ? 注意此时的 cut rule 在这里是无法奏效的,我好想想不到这样 proof td.

Theorem 188 Simplified sequent calculus is soundness and completeness, that is

- If  $\Gamma \to C$  then  $\Gamma \Rightarrow C$ ;
- If  $\Gamma \Rightarrow C$  then  $\Gamma \rightarrow C$ .

PROOF 依旧是 straightforward structure induction.

### 4.2 Invertibility

Annotation 189 Why Invertibility? [13] 我们想构造一个 automation for proof searching,可能会面临一些问题. 假设我们想要找  $\Gamma \vdash C$  的 verification,其中  $\Gamma$  包含 n-1 个 formuals,这意味我们要从 n 个 formuals(加上 C),挑一个出来作为 main formual,对其 apply 对应的 rules. 如果我们挑到正确的那个 rule,将会导致都后续一定会出错,因此我们要考虑 backtrack. 例如证明  $B \to A \lor B$  时,我们对 right side 挑  $\lor R_1$  rule

$$\frac{\Gamma \to A}{\Gamma \to A \vee B} \vee R_1,$$

这显然就出问题了. 这样看起来我们得找到一个可以接受的 search algorithm,这里有策略是我们可以尽可能选right choice,直到选不出时候,我们再 make a choice. 这样做的好处是我们可以尽可能减少 backtrack,同时一旦选择了 bad choice,那么无论你后续怎么选都还是错的,因此我还可以直接 remove 掉 bad choice.那么如何选 right choice,就引出了 invertible rule的概念.

**Definition 190** A rule p is called invertible in a sequent calculus system if a proof of its conclusion implies the existence of proofs of each of its premises.

Annotation 191 简而言之就是可以从 conclusion is vaild 推出 premise is vaild.

**Lemma 192** The left rule for disjunction is invertible.

$$\frac{\Gamma, A \to C \quad \Gamma, B \to C}{\Gamma, A \vee B \to C} \ \lor L$$

PROOF 很直接.

$$\frac{\overline{\Gamma,A\to A} \stackrel{id}{id}}{\overline{\Gamma,A\to A\vee B}} \vee R_1 \quad \Gamma,A,A\vee B\to C \\ \overline{\Gamma,A\to C} \quad cut \quad \frac{\overline{\Gamma,B\to B} \stackrel{id}{id}}{\overline{\Gamma,B\to A\vee B}} \vee R_2 \quad \Gamma,B,A\vee B\to C \\ \overline{\Gamma,B\to C} \quad cut$$

Lemma 193 Both rules for conjunction are invertible.

Lemma 194 The right rule for implication is invertible.

Proof that is

$$\begin{array}{cccc} \underline{\Gamma, A, A \supset B \to A} & init & \overline{\Gamma, A, B \to B} & init \\ \underline{\Gamma, A, A \supset B \to B} & \overline{\Gamma, A, A \supset B \to B} & \\ \overline{\Gamma, A \to B} & \end{array}$$

Annotation 195 为什么 the left rule of implication is not invertible? 因为从 conclusion 推不出 left premise.

### **Definition 196** Proof searching algorithm. Assuming we want prove $\Gamma \to C$

- 1. Starting with formula on right C, apply invertible rules as long as we can
- 2. When the only rule left to be applied on the right is non-invertible, we say  $C^+$ , stop working there and move to left.
- 3. Process the formulas in the left context  $\Omega$  in order:
  - (a) If the rule to be applied is invertible, go ahead and apply it, keeping the possibly generated subformulas in the front of the list.
  - (b) If the rule to be applied is non-invertible or the formula is atomic, move it to a side context  $\Gamma^-$  to delay working with it.
- 4. When we have absolutely no other choice, we can either apply a noninvertible rule on the right or on the left. Then we move the focus to the newly generated formulas in the hope they require invertible.

that  $\Omega$  is context of left side, which is ordered and holds any formuals; and  $\Gamma^-$  which holds only atoms or formuals that require non-invertible left rules.

**Annotation 197** 接下来就是详细解释  $\Omega$  和  $\Gamma$ <sup>-</sup> 是如何构造的.

**Definition 198** We will label the sequent arrows with R or L, depending on whether we are on a right inversion phase or left inversion phase.

$$\Gamma^-;\Omega\xrightarrow{R}C$$

$$\Gamma^-; \Omega \xrightarrow{L} C$$

**Definition 199** Formalization of proof searching algorithm for  $\Gamma \to C$ .

- 1. START:  $\cdot; \Omega \xrightarrow{R} C$ , where  $\Gamma^-$  is empty and  $\Omega = \Gamma$ .
- 2. Process right side:
  - (a) The right inversion phase consists of applying right invertibale rule:

$$\frac{\Gamma^{-};\Omega\xrightarrow{R}A\quad\Gamma^{-};\Omega\xrightarrow{R}B}{\Gamma^{-};\Omega\xrightarrow{R}A\wedge B}\wedge R$$

$$\frac{\Gamma^{-};\Omega\xrightarrow{R}A\wedge B}{\Gamma^{-};\Omega\xrightarrow{R}A\supset B}\supset R$$

$$\frac{\Gamma^{-};\Omega\xrightarrow{R}A\supset B}{\Gamma^{-};\Omega\xrightarrow{R}T} \top R$$

(b) If we reach an atom on the right side, we either check if it is in  $\Gamma^-$  and close the branch with *init*, or we move to apply left inversion rules.

$$\frac{P \in \Gamma^{-}}{\Gamma^{-}; \Omega \xrightarrow{R} P} init$$

$$\frac{P \notin \Gamma^{-} \quad \Gamma^{-}; \Omega \xrightarrow{L} P}{\Gamma^{-} \cdot \Omega \xrightarrow{R} P} LR_{P}$$

(c) The only other cases left are when the right formula is disjunction or  $\bot$ . At this pointwe stop working on the right and move to the left.

$$\frac{\Gamma^{-}; \Omega \xrightarrow{L} A \vee B}{\Gamma^{-}; \Omega \xrightarrow{R} A \vee B} LR_{\vee}$$

$$\frac{\Gamma^{-}; \Omega \xrightarrow{L} \bot}{\Gamma^{-}; \Omega \xrightarrow{R} \bot} LR_{\bot}$$

- 3. Process left side:
  - (a) The left inversion phase processes the formulas in  $\Omega$  in order, always taking the rightmost one.

$$\begin{split} \frac{\Gamma^{-};\Omega,A,B \xrightarrow{L} C^{+}}{\Gamma^{-};\Omega,A \wedge B \xrightarrow{L} C^{+}} \wedge L \\ \frac{\Gamma^{-};\Omega,A \xrightarrow{L} C^{+} \quad \Gamma^{-};\Omega,B \xrightarrow{L} C^{+}}{\Gamma^{-};\Omega,A \vee B \xrightarrow{L} C^{+}} \vee L \end{split}$$

(b) If the first formual in  $\Omega$  is  $\bot$ , we can close the branch; If it is  $\top$  we can remove it form our list.

(c) If we encounter an atom, we can close the branch if it is equal to the right side or we can move it. and only case left is an implication, we also can move it to  $\Gamma^-$ .

$$\frac{\Gamma^{-};\Omega,P\overset{L}{\to}P}{\stackrel{L}{\to}P}init$$

$$\frac{\Gamma^{-},P;\Omega\overset{L}{\to}C^{+}}{\Gamma^{-};\Omega,P\overset{L}{\to}C^{+}}\operatorname{shift}_{P}$$

$$\frac{\Gamma^{-},A\supset B;\Omega\overset{L}{\to}C^{+}}{\Gamma^{-};\Omega,A\supset B\overset{L}{\to}C^{+}}\operatorname{shift}_{\supset}$$

#### 4. END:

(a) We will end-up with a sequent where  $\Omega$  is empty. Its time to make a choice by applying non-invertible rules.

$$\frac{\Gamma^{-}; \cdot \xrightarrow{R} A}{\Gamma^{-}; \cdot \xrightarrow{R} A \vee B} \vee R_{1} \qquad \frac{\Gamma^{-}; \cdot \xrightarrow{R} B}{\Gamma^{-}; \cdot \xrightarrow{R} A \vee B} \vee R_{2}$$

$$\frac{\Gamma^{-}, A \supset B; \cdot \xrightarrow{L} A \quad \Gamma^{-}; B \xrightarrow{L} C^{+}}{\Gamma^{-}, A \supset B; \cdot \xrightarrow{L} C^{+}} \supset L$$

- (b) After a choice is made, we try to go back to an inversion phase by using the sequent arrow corresponding to where auxiliary formulas went.
- (c) If it is failed at one choice, then we can backtrack to choice points.

Annotation 200 上述算法的核心我们称其为focuing, 它是 proof search 中非常重要的一个环节.

### 4.3 Contraction-free

Annotation 201 在 simplified sequent calculus 中 left implication rule 里面的 left premise 还是留着 main formula, 即

$$\frac{\Gamma, A \supset B \to A \quad \Gamma, B \to C}{\Gamma, A \supset B \to C} \supset L$$

这时你如果考虑对上面的 left primise 再使用一下  $\supset L$ ,你会发现又得到了  $\Gamma, A \supset B \to A$ ,这意味你可能陷入 在 proof searching 中陷入 loop. 为了尝试解决这个问题,同时让我们的 proof searching 变成更加的 decidable,我需要分解  $\supset L$ ,以归纳 A 的结构为切入点.

**Example 202** 如果  $A \neq \text{atom}$ , 那么此时的  $\subset L$  对应的 instance 为

$$\frac{\Gamma, a \supset B \to a \quad \Gamma, B \to C}{\Gamma, a \supset B \to C} \supset L$$

这里分三种情况讨论 left premise 的 subproof:

- 1. 如果  $a \in \Gamma$ , 那么显然我们是可以 close 掉 left subproof, 直接以 right premise 作为前提.
- 2. 如果继续对 left premise 继续使用  $\subset L$ ,前面说了没有意义,更何况这里 A 还只是一个 atom. 那么什么 时候重复 apply  $\subset L$  有意义呢? 除非我们还想从 A 里面提取点其他的信息,例如  $A = A_1 \vee A_2$ ,可以两次 apply  $\subset L$ ,再利用一下  $\vee R_1$  和  $\vee R_2$  就能得到不一样的信息.
- 3. 如果从 Γ 里面挑一个 formula 出来 apply rules, 那么这里可能有两种选择, 要么 apply invertible rule 或者 non-invertible rule. 对于 non-invertible rule 而言, 这里只能选择 ⊃ L, 因为此时 right side 是一个 atom. 当我们考虑 delay applying ⊃ L for a ⊃ B, apply invertible rule and other left implication as possible we can, 我们最终会回到第一种情况.

因此我们分析告诉我们在这种情况下, 我可以将  $\supset L$  化简为

$$\frac{\Gamma, a, B \to C}{\Gamma, a, a \supset B \to C} \ a \supset L$$

注意我们在 conclusion 中显式的标注 a 的存在,才能 closed 掉 left branch.

**Example 203** 如果  $A \neq A_1 \land A_2$ ,考虑以下 logical equivalent:

$$(A_1 \wedge A_2) \supset B \equiv A_1 \supset (A_2 \supset B)$$

为什么要这样换呢?可以对比一下下面的两个 derivations:

$$\frac{\Gamma, (A_1 \wedge A_2) \supset B \to A_1 \quad \Gamma, (A_1 \wedge A_2) \supset B \to A_2}{\Gamma, (A_1 \wedge A_2) \supset B \to A_1 \wedge A_2} \wedge R \quad \Gamma, B \to C}{\Gamma, (A_1 \wedge A_2) \supset B \to C} \supset L$$

$$\frac{\Gamma, A_1 \supset (A_2 \supset B) \to A_1}{\Gamma, A_1 \supset (A_2 \supset B) \to C} \xrightarrow{\Gamma, A_2 \supset B \to C} \supset L$$

$$\frac{\Gamma, A_1 \supset (A_2 \supset B) \to C}{\Gamma, A_1 \supset (A_2 \supset B) \to C} \supset L$$

很显然后者我们将所有 antecedent 里面 implication 都简化了,每个 implication 都只依赖一个 assumption,这样是有利于我们做归纳的. 因此在这里情况下可以简化  $\supset L$  为

$$\frac{\Gamma, A_1 \supset (A_2 \subset B) \to C}{\Gamma, (A_1 \lor A_2) \subset B \to C} \land \subset L$$

Example 204 若 A 为  $A_1 \lor A_2$ , 这里依然使用一个 logical equivalent:

$$(A_1 \vee A_2) \supset B \equiv (A_1 \supset B) \wedge (A_2 \supset B)$$

这样我们就不需要再使用  $\vee R$  来从  $A_1 \vee A_2$  获得信息,因此这里简化的  $\subset L$  为

$$\frac{\Gamma, A_1 \supset B, A_2 \supset B \to C}{\Gamma, (A_1 \lor A_2) \supset B \to C} \lor \supset L$$

Example 205 若  $A \to A_1 \supset A_2$ ,我们可以尝试先 derivation 一下

$$\frac{\Gamma, (A_1 \supset A_2) \supset B, A_1 \to A_2}{\Gamma, (A_1 \supset A_2) \supset B \to A_1 \supset A_2} \supset R \quad \Gamma, B \to C}{\Gamma, (A_1 \supset A_2) \supset B \to C} \supset L$$

其中这里有一个 logical equivalent:

$$(A_1 \supset A_2) \supset B \land A_1 \equiv (A_2 \supset B) \land A_1$$

因此这里简化的  $\supset L$  为

$$\frac{\Gamma, (A_2 \supset B), A_1 \to A_2 \quad \Gamma, B \to C}{\Gamma, (A_1 \supset A_2) \supset B \to C} \supset L$$

Example 206 若 A 为  $\top$ , 显然有

$$\frac{\Gamma, B \to C}{\Gamma, \top \subset B \to C} \top \supset L$$

因为 left branch  $\Gamma$ ,  $\top$   $\subset$  B  $\to$   $\top$  显然是可以直接 close 掉的.

Example 207 若 A 为  $\bot$ , 这里有一个显然的 logical equivalent:

$$\bot \subset B \equiv A$$

因此这里简化的  $\supset L$  为

$$\frac{\Gamma \to C}{\Gamma, \bot \subset B \to C} \ \bot \supset L$$

**Definition 208** We call simplified sequent calculus with above compound left rules except original left implication G4ip: Contraction-free calculus for intuitionistic logic.

**Theorem 209** (Soundness) If the sequent  $\Gamma \to C$  is derivable in G4ip, then it is derivable in sequent calculus.

PROOF 首先将 G4ip 中的 derivation 写成二维的形式  $\Gamma \to C$ , 对  $\mathcal{D}$  做 structure induction. 首先是 bases cases, 即  $\mathcal{D}$  为 empty 的 cases,显然这些 cases 对应的 rules 在 Gi4p 和 sequent calculus 中是保持一致. 再假设  $\mathcal{D}, \mathcal{E}$  is a proof,其对应在 sequent calculus 中的 proof 为  $\mathcal{D}', \mathcal{E}'$ . 下面就是证明以它们为 subproof 的 cases,其中只需要证明关于 implication rules,整个过程是非常 straightforward.

**Annotation 210** 要证明 completeness of derivability in G4ip, 我们得先证明 terminitation of proof searching in G4ip, 因为现在没有 soundness 中的前提条件了. 那是什么原因导致我们会担心会不会 terminated 呢? 因为  $\wedge \supset L$ 

$$\frac{\Gamma, A_1 \supset (A_2 \subset B) \to C}{\Gamma, (A_1 \lor A_2) \subset B \to C} \land \subset L$$

看起来 premise 和 conclusion 似乎有相同的规模,这里能否保证 termination? 这里引入 weight 来证明它,很奇妙的规则,至少我还没有洞悉它.

**Definition 211** (Weight) For each propositional formula A, we assign it a weight as follow:

- $w(A) = w(\top) = w(\bot) = 2$  for atomic A;
- $w(A \wedge B) = w(A)(1 + w(B));$
- $w(A \vee B) = 1 + w(A) + w(B)$ ;
- $w(A \supset B) = 1 + w(A)w(B)$ .

Lemma 212 For each rule in G4ip, its premises have a strictly lower weight than its conclusion.

PROOF 需要每个例子都验证一遍. 这里我只验证一下上面提到的例子.

$$w(A_1 \supset (A_2 \supset B)) = 1 + w(A_1)(1 + w(A_2)(B))$$
$$= 1 + w(A_1) + w(A_1)w(A_2)w(B)$$

$$w((A_1 \land A_2) \supset B) = 1 + w(A_1)(1 + w(A_2))w(B)$$
$$= 1 + w(A_1)w(B) + w(A_1)w(A_2)w(B)$$

其中  $w(A_1) \ge 2$ , 因此  $w(A_1 \supset (A_2 \supset B)) \le w((A_1 \land A_2) \supset B)$ .

**Theorem 213** (Termination) Proof search in G4ip is terminating

PROOF It is straightforward by Lemma 212.

**Theorem 214** (Completeness) If the sequent  $\Gamma \to C$  is provable in sequent calculus, then it is provable in G4ip.

PROOF 我们需要更细粒度的 structure induction 来处理  $\supset L$ ,因此我们这里采用induction on the weight of the sequent,这是非常重要的一个 trick. 对于给定一个 sequent,我们得思考 sequent bigger than it,同时我们最好以 proof searching 的视角去看待,这样会让我们讨论的 proof 更加的具体. 这里记录几个 representative cases.

*Case 1* 
$$\stackrel{\cdot}{=}$$
 Γ = Γ',  $A \wedge B$ 

根据 proof searching 中 invertibility 的策略,可以得到一个 provable premise  $\Gamma', A, B \to C$ ,而它的 weight 小于原 sequent,因此这里可以使用 induction hypothesis 得到它在 G4ip 也是 provable, 接着再使用  $\wedge L$  in G4ip 即可.

Case 2  $\stackrel{\cdot}{=} \Gamma = \Gamma', a, a \supset B$ 

这里你会发现 sequent calculus 里面没有 rules 可以用,但是我们可以站在更高的一点地方来看它. 如果  $\Gamma', a, a \supset B \to C$  is provable, 那么存在一个 derivation  $\mathcal{D}$  end with it,若我们可以从这个 derivation 推出  $a \supset L$  的 premise,我们就可以正常使用  $a \supset L$  得到我们想要的结果,这实际就是要说明  $a \supset L$  is invertible.

$$\frac{\overline{\Gamma, a, B, a \to B}}{\overline{\Gamma, a, B \to a \supset B}} \stackrel{id}{\supset} R \quad \underset{\Gamma, a, a}{\Gamma, a, a} \stackrel{\mathcal{D}}{\supset} B \vdash C \quad cut$$

## 5 Logical Programming

### 5.1 Backward Chaining

Annotation 215 Proof searching as computation

**Definition 216** We define Horn clauses includes two classes: G denotes goal clauses and P denotes program clauses. They are defined by the following grammer (where A denotes an atom):

$$G := A \mid G \land G \mid \exists x.G$$
$$P := A \mid B \supset A \mid \forall x.P$$
$$B := A \mid B \land B$$

In words: goals are existentially quantified conjunction of atoms. Programs are either atoms or implications where the antecedent is conjunction of atoms and succedent is an atom, both universally quantified.

**Definition 217** A logic program is a sequent  $\mathcal{P} \to G$  where the  $\mathcal{P}$  contains only program clauses and G is a goal clause.

Example 218 给定下述 logic program:

$$\forall x.plus(0,x,x), \\ \forall x.\forall y. \forall z.plus(x,y,z) \supset plus(s(x),y,s(z)) \\ \rightarrow \exists x.plus(s(0),s(s(0)),x)$$

其中 plus 是一个 predicate symbol, 而 0 和 s 是 function symbols. 如果我们希望上述 logica program processing(computing) like proof searching in sequent calculus, 即以 proof searching 的方式去构造这个 sum. 那么首先我们得思考要构建一个怎样的 proof system?

**Definition 219** (Representative proof system) Each clause will be represented as a rule: atoms are rules without premises, implications are rules where the premises are the atoms in B and the conclusion is the succdent. The program computing sums we had before will thus become:

$$\frac{plus(0,X,X)}{plus(0,X,X)} \ plus_0 \qquad \frac{plus(X,Y,Z)}{plus(s(X),Y,s(Z))} \ plus_s$$

**Annotation 220** 回到 Example 218, 我们可以构造一个 proof 说明 x 可以为 s(s(s(x))).

$$\frac{\overline{plus(0,s(s(0)),s(s(0)))}}{plus(s(0),s(s(0)),s(s(s(x))))} \begin{array}{l} plus_0 \\ plus(s(0),s(s(0)),s(s(s(x)))) \end{array}$$

**Definition 221** Bottom-up proof search is called backward chaining; top-down proof search is called forward chaining.

Annotation 222 Backward chaining 指的就是从 conclusion 推 hypotheses, 这个过程包含的几个重要环节为:

- 1. 从 conclusion 找对应的 inference rules, 这个过程我们称为pattern match.
- 2. 如果某个地方 proof searching 进行不下去了导致 failed,需要回到到某个点重新选择 inference rules,或者 没有这样点导致整体完全 failed. 这个过程我们称为backtracking.
- 3. 以 Exmaple 218为例,它的 conclusion 含有一个未知的 variable x,那这个时候该如何进行第一步呢?我们首先用一个 symbol X 来占位,那么此时 conclusion 为 plus(s(0),s(s(0)),X),现在它其实可以叫做我们当前的 goal. 此时我们只有第二个 program clause 可以用,因为第一个 program clause require 第一个数得是 0. 那么问题又来了

$$\frac{plus(0,s(s(0)),?)}{plus(s(0),s(s(0)),X)} \ plus_s$$

这里我们也可以用另外一个 symbol Y 来占位,即 plus(0, s(s(0)), Y),此时的 goal 只有第一个 program clause 可以对应,同时我必须将 Y 替换为 s(s(0)),因为此时没有 far premises 了. 将占位 symbols 替换为 指定的 terms 过程我们就称为unification. 当 Y 替换之后,X 配合  $plus_s$  rule 就自然地推出来了. 在最开始 X 这里,我们还不能进行 unify 操作,因为还不是那么明显,因此我们可以 delay it. 后续我们将详细介绍 unification 操作.

4. 如果 apply 某个 inference rule 得到了多个 premises,这样我们可能有多个 goal 需要去 resolve,这里采用depth-first的手法.

Example 223 为什么 disjunction 没有出现在上面的 Horn clauses 里面呢?我们可以来看一个 derivable sequent:

$$p(a) \lor p(b) \to \exists x. p(x)$$

这里我们显然是无法找到 x 满足 p(x), 那么我们的 unify 操作在这里是行不通的.

# 5.2 Prolog

Definition 224 Prolog is a logic programming language implementing backward chaining on Horn clauses.

Example 225 一段 Prolog 程序实际上就是一堆 clauses, 这些 clauses 可以分为两类:

1. A clause may be a fact we know about the world. For example:

```
mother(li, maple). father(hu, maple).
```

Each of those is an atom(predicate) and they are interpreted as a logical formula: e.g., the first fact is  $mother(li, maple) \supset \top$ , but why?

2. A clause may be a rule in the shape:

```
head:-body
```

meaning that head is true if body is true. The head is atom, but the body can be conjunction of atoms. We can have following ruls for family relations, for example:

```
parent(X,Y) := mother(X, Y).

parent(X,Y) := father(X, Y).

sibling(X,Y) := parent(Z,X), parent(Z,X).
```

It also has a representation as logical formulas, for example, the last clause is  $\forall x. \forall y. \forall z. (parent(z, x) \land parent(z, y) \supset sibling(x, y)).$ 

当我们有了上面这些 clauses 之后, 我们就可以来做一些 querys, 例"maggie 的 parent 是谁?", parent(X, maggie). Prolog 以它作为 current goal, 开始搜索 head 是 parent 的那些 clauses, 找到对应的 body 里面的 subgoals, 接着周而复始, 直到最后 facts, 这过程充斥着我们提到的 backtracking 和 unification.

```
Example 226 一个非常神奇的例子: quicksort.
quicksort([], []).
quicksort([X|Xs], Ys) :- partition(Xs, X, Ls, Gs),
                           quicksort(Ls, S1),
                           quicksort(Gs, Sr),
                           append(S1, [X|Sr], Ys).
partition([], _, [], []).
partition([X|L], P, [X|Ls], Gs) :- X < P,
        partition(L, P, Ls, Gs).
partition([X|L], P, Ls, [X|Gs]) :- X >= P,
        partition(L, P, Ls, Gs).
配合 trace 理解它:
          1 Call: quicksort([2,3,1],_29) ?
     1
     2
          2 Call: partition([3,1],2,_100,_101) ?
          3 Call: 3<2 ?
     3
     3
          3 Fail: 3<2 ?
          3 Call: 3>=2 ?
     3
          3 Exit: 3>=2 ?
          3 Call: partition([1],2,_153,_87) ?
          4 Call: 1<2 ?
     5
          4 Exit: 1<2 ?
          4 Call: partition([],2,_140,_87) ?
          4 Exit: partition([],2,[],[]) ?
     6
          3 Exit: partition([1],2,[1],[]) ?
     2
          2 Exit: partition([3,1],2,[1],[3]) ?
     7
          2 Call: quicksort([1],_233) ?
          3 Call: partition([],1,_259,_260) ?
     8
          3 Exit: partition([],1,[],[]) ?
     9
          3 Call: quicksort([],_284) ?
     9
          3 Exit: quicksort([],[]) ?
          3 Call: quicksort([],_309) ?
    10
          3 Exit: quicksort([],[]) ?
    10
          3 Call: append([],[1],_337) ?
    11
    11
          3 Exit: append([],[1],[1]) ?
          2 Exit: quicksort([1],[1]) ?
     7
```

```
2 Call: quicksort([3],_363) ?
12
     3 Call: partition([],3,_389,_390) ?
13
     3 Exit: partition([],3,[],[]) ?
13
     3 Call: quicksort([],_414) ?
14
14
     3 Exit: quicksort([],[]) ?
15
     3 Call: quicksort([],_439) ?
     3 Exit: quicksort([],[]) ?
15
     3 Call: append([],[3],_467) ?
     3 Exit: append([],[3],[3]) ?
16
12
     2 Exit: quicksort([3],[3]) ?
17
     2 Call: append([1],[2,3],_29) ?
17
     2 Exit: append([1],[2,3],[1,2,3]) ?
1
     1 Exit: quicksort([2,3,1],[1,2,3]) ?
```

其中第一列数字表示具体哪个 call, 第二列数字表示 the depth of goal, 其中带下划线的数字表示占位的 variable, 等待被 unified. 可以看到第 8 次 call 的时候第一次 unify.

## 5.3 Focusing

Annotation 227 首先扩充一下 4.2小节提到的 invertible calculus 到 first order logic. 这里我们只记录新引入的 inference:

	$\frac{\Gamma^{-};\Omega\xrightarrow{R}A[c/x]}{\Gamma^{-};\Omega\xrightarrow{R}\forall x.A} \ \forall R $ where $c$ is fresh variable		
Right invertible rules	$\Gamma^-; \Omega \xrightarrow{R} \forall x. A$ where c is fresh variable		
	$\frac{\Gamma^{-}; \Omega \xrightarrow{L} \exists x.A}{\Gamma^{-}; \Omega \xrightarrow{R} \exists x.A} LR_{\exists}$		
Side change	$\Gamma^-; \Omega \xrightarrow{R} \exists x.A$		
	$\frac{\Gamma^{-}, \Omega, A[c/x] \xrightarrow{L} C^{+}}{\Gamma^{-}, \Omega, \exists x. A \xrightarrow{L} C^{+}} L \exists $ where $c$ is fresh variable		
Left invertible rules	$\Gamma^-, \Omega, \exists x. A \xrightarrow{L} C^+$ where c is fresh variable		
	$\frac{\Gamma^{-}, \forall x.A; \Omega \xrightarrow{L} C^{+}}{\Gamma^{-}; \Omega, \forall x.A \xrightarrow{L} C^{+}} shift_{\forall}$		
Shift rules	$\Gamma^{-}; \Omega, \forall x. A \xrightarrow{L} C^{+} Shift_{\forall}$		
Noninvertible rules	$ \frac{\Gamma^{-}; \cdot \xrightarrow{L} A[t/x]}{\Gamma^{-}; \cdot \xrightarrow{L} \exists x.A} R \exists \frac{\Gamma, \forall x.A; A[t/x] \to C^{+}}{\Gamma, \forall x.A; \cdot \to C^{+}} L \forall \text{ where } t \text{ is term} $		

这里有两个感觉很奇怪的 rules  $L\exists$  和  $L\forall$ ,首先这和我们直觉上关于  $\exists$  和  $\forall$  的 introduction rule 不太一样,而  $R\exists$  和  $R\forall$  是符合我们直觉的. 我们从"怎么用这两个条件"来解释:

- 在一般情况下,如果我们有一个关于 type  $\tau$  存在性命题,那么通常我们会假设其存在用某个 symbol 满足  $\tau$  同时满足当前命题,让 prove 过程进行下去, $L\exists$  就是采用的这种直觉.
- 而当存在一个关于 type  $\tau$  全称命题的时候,那么我们会取一个任意满足  $\tau$  的 term,来让 prove 过程进行下,同时 keep 这个全称命题,万一取错了,我们还可以再取.

上面是我个人觉得比较合理的解释.

**Definition 228** Positive connectives are those that have invertible left rules and non-invertible right rules.

Definition 229 Negative connectives are those that have non-invertible left rules and invertible right rules.

**Annotation 230** 那么  $\lor$ ,  $\bot$ , ∃ 都是 positive, 而  $\supset$ , ∀ 都是 negative. 至于  $\land$  和  $\top$  它们是 both positive and negative, 我们称其为neutral.

Annotation 231 利用 polarity 的 defintion, 我们可以做一些 generalization. 将  $LR_P, LR_{\lor}, LR_{\bot}, LR_{\exists}$  可以统一为

$$\frac{\Gamma^{-}; \Omega \xrightarrow{L} C_{a}^{+}}{\Gamma^{-}; \Omega \xrightarrow{R} C_{a}^{+}} LR$$

类似地,可以将 shitf<sub>P</sub>, shitf<sub>¬</sub>, shitf<sub>∀</sub> 统一为

$$\frac{\Gamma^{-}, C_{a}^{-}; \Omega \xrightarrow{L} C_{a}^{+}}{\Gamma^{-}; \Omega, C_{a}^{-} \xrightarrow{L} C_{a}^{+}} shift$$

**Definition 232** we define *focus* rule for deciding which formula to focus on , after exhausting all invertible rule on the rule and on the right.

$$\frac{\Gamma^{-}; \cdot \xrightarrow{R} [P]}{\Gamma^{-}; \cdot \xrightarrow{L} P} focus_{r} \qquad \frac{\Gamma^{-}, N; [N] \xrightarrow{R} C_{a}^{+}}{\Gamma^{-}, N; \cdot \xrightarrow{L} C_{a}^{+}} focus_{r}$$

where [F] donates which non-invertible formula in focus, P is positive formula and N is negative formula.

**Definition 233** We define *synchronous* rule as follow:

$$\frac{\Gamma^{-}; \cdot \xrightarrow{R} [A]}{\Gamma^{-}; \cdot \xrightarrow{R} [A \vee B]} \exists R_{1} \qquad \frac{\Gamma^{-}; \cdot \xrightarrow{R} [A]}{\Gamma^{-}; \cdot \xrightarrow{R} [A \vee B]} \exists R_{2} \qquad \frac{\Gamma^{-}; \cdot \xrightarrow{R} [A[t/x]]}{\Gamma^{-}; \cdot \xrightarrow{R} [A \times A]} \exists R_{1}$$

$$\frac{\Gamma^{-}; \cdot \xrightarrow{R} [A] \quad \Gamma^{-}; [B] \xrightarrow{L} C_{a}^{+}}{\Gamma^{-}; [A \supset B] \xrightarrow{L} C_{a}^{+}} \supset L \qquad \frac{\Gamma^{-}; [A[t/x]] \xrightarrow{L} C_{a}^{+}}{\Gamma^{-}; [\forall x.A] \xrightarrow{L} C_{a}^{+}} \forall L$$

**Definition 234** We define *blur* rules to remove focus as follow:

$$\frac{\Gamma^{-}; \cdot \xrightarrow{R} N}{\Gamma^{-}; \cdot \xrightarrow{R} [N]} blur_{r} \qquad \frac{\Gamma^{-}; P \xrightarrow{L} C_{a}^{+}}{\Gamma^{-}; [P] \xrightarrow{L} C_{a}^{+}} blur_{r}$$

where N is negative formula and P is positive formula.

**Definition 235** We define new *init* rules under focus as follow:

$$\frac{1}{\Gamma^{-};[a^{-}] \xrightarrow{L} a^{-}} init_{L} \qquad \frac{a^{+} \in \Gamma^{-}}{\Gamma^{-}; \cdot \xrightarrow{R} [a^{+}]} init_{R}$$

**Annotation 236** 注意在235中给 atoms 也添加上了 polarity,本质上 atoms 可以是 positive,也可以是 negative. 在 *init* rules 为了确保 focus [F] 保持原本的含义,因此对应的 atom 的 polarity 也要保持一致.

**Definition 237** The system with all above rules called first logic focused calculus.

Annotation 238 引入 focus rules 会造成整体的 the shape proof searching 发生变化, 当你 made a choice 之后选择了某个 non-invertible formula, focus 操作会强制使得这个 non-invertible formula 直到被分解成了 invertible subformula 才会去掉 focus. 同时 init rule 只有在 atom 在 focused 的时候才有可能被 applied. 对比4.2节的 proof

searching algorithm,我们可以在 make a choice 之后,如果遇到无法处理的 subformula is atom on left,我们可以做一下 shift 操作把它放到  $\Gamma^-$  里面去,转而处理其他的 formula. 但是在这里不行你如果碰到了无法处理的 focused atom,你就得 backtracking 了,这就是最大的区别. 然而 backtracking 也是技术的,我们需要恢复到上述最早 focused non-invertible formula,然后换个 non-invertible 来继续 focus.

Annotation 239 这里我们想来解释一下 definition 233里面的synchronous的含义. 字面意思同步处理,从另外一个方式思考那么对 invertible formula 的处理就叫 asynchronous rules,即异步处理. 试想如果现在拿掉 side change rules,两个都各自有一个 invertible formula,实际上谁先谁后实际并没有太本质的区别,这就是 asynchronous 的含义. 而对 non-invertible formula 的处理,我们需要来一个一个的做选择,一个不行就换下一个,这就是 synchronous 的含义.

**Definition 240** (Simpifiled focus calculus) The system gather all invertible rules to asynchronous rules and removes side change rule based on first logic focus calculus is called LJF

### 5.4 Polarities

Annotation 241 这小节将通过一个例子解释 how uniform proof works 和为什么赋予 atoms 不同的 polarity 将导致 shape of proof searching.

Example 242 给定一个 non-standard(inlined arithmetic op) prolog program of Fibonacci:

fib(0, 0).

fib(1, 1).

$$fib(n+2, f2 + f2) := fib(n + 1, f1), fib(n, f2).$$

然后我们需要想要证明 fib(5,5),在逻辑上等价于证明下述 sequent

$$\begin{array}{c} fib(0,0), fib(1,1), \\ \forall n. \forall f_1. \forall f_2. (fib(n+1,f_1) \land fib(n,f_2) \supset fib(n+2,f_1+f_2)) \end{array} \longrightarrow fib(5,5)$$

这里我们将其放到 LJF240中来证明.

• 首先以

$$\cdot; \Gamma \to fib(5,5)$$

作为 end-sequent. 这里只能首先 apply *shift* rule 把  $\Gamma$  放到  $\Gamma^-$ , 因为两边都没有办法使用 synchronous and asynchronous rules. 这里需要连续使用 3 次 *shift*,得到

$$\Gamma; \cdot \to fib(5,5)$$
  
 $shift \times 3$   
 $\cdot; \Gamma \to fib(5,5)$ 

- 此时我们如果对 atoms assign different polarity 将会使得从不同的方向继续进行证明:
  - 1. 假设atoms are negative, 那么显然 right atom fib(5,5) 是无法被 focused, 只能依次 focus  $\Gamma^-$  里面的 formulas. 对于 fib(0,1) 和 fib(1,1),这里  $init_l$  显然是用不了,因为它们并没有在 right side 出现. 那么只能选择最后的 universal quantified formula 了.
  - 2. 假设atoms are positive formula, 那么这里 right atom 就可以被 focus 了, 但是这里对应的 *init<sub>r</sub>* 还是用不了. 因此最后也能选择 left side's universal quantified formula.
- 此时我们 focus left side's universal quantified formula 并且 apply 3 times ∀L,则有

$$\Gamma; [(fib(n+1, f_1), fib(n, f_2) \supset fib(n+2, f_1+f_2))] \to fib(5, 5)$$

$$\forall L \times 3$$

$$\Gamma; [\forall n. \forall f_1. \forall f_2. (fib(n+1, f_1) \land fib(n, f_2) \supset fib(n+2, f_1+f_2))] \to fib(5, 5)$$

$$\Gamma; \cdot \to fib(5, 5)$$

$$shift \times 3$$

$$\cdot; \Gamma \to fib(5, 5)$$

• 此时依然处于 focus 当中,继续 apply  $\supset L$ ,则有

$$\frac{\Gamma; \cdot \rightarrow [fib(n+1,f_1) \land fib(n,f_2)] \quad \Gamma; [fib(n+2,f_1+f_2)] \rightarrow fib(5,5)}{\Gamma; [(fib(n+1,f_1) \land fib(n,f_2) \supset fib(n+2,f_1+f_2))] \rightarrow fib(5,5)} \supset L$$

$$\frac{\Gamma; [\forall n. \forall f_1. \forall f_2. (fib(n+1,f_1) \land fib(n,f_2) \supset fib(n+2,f_1+f_2))] \rightarrow fib(5,5)}{\Gamma; \cdot \rightarrow fib(5,5)} \quad focus_l$$

$$\frac{\Gamma; \cdot \rightarrow fib(5,5)}{shift \times 3}$$

$$\cdot; \Gamma \rightarrow fib(5,5)$$

• 其中 left branch 现在可以使用 blur, 去掉 focus 了,则有

branch 现在可以使用 
$$blur_r$$
 去掉 focus 了,则有 
$$\frac{\Gamma; \cdot \to fib(n+1,f_1) \quad \Gamma; \cdot \to fib(n,f_2)}{\Gamma; \cdot \to fib(n+1,f_1) \land fib(n,f_2)} \land R$$
 
$$\frac{\Gamma; \cdot \to fib(n+1,f_1) \land fib(n,f_2)}{\Gamma; (fib(n+1,f_1) \land fib(n,f_2))} \begin{array}{c} blur_r \\ \Gamma; (fib(n+2,f_1+f_2)) \to fib(5,5) \\ \hline \Gamma; [(fib(n+1,f_1) \land fib(n,f_2) \supset fib(n+2,f_1+f_2))] \to fib(5,5) \\ \hline \lor L \times 3 \\ \hline \Gamma; [\forall n. \forall f_1. \forall f_2. (fib(n+1,f_1) \land fib(n,f_2) \supset fib(n+2,f_1+f_2))] \to fib(5,5) \\ \hline \Gamma; \cdot \to fib(5,5) \\ \hline Shift \times 3 \\ \hline \cdot; \Gamma \to fib(5,5) \end{array}$$

- 从这里开始就可以变得有趣了,注意三个标蓝色的formulas现在都是 atoms 同时它们都是被 variables 包裹 了,我们就可以对其做 unify 了,但是不同 polarity of atoms 将构造完全的不同的 proof searching.
  - 1. 如果atoms are negative, 那么最终只能用 init, 来 close 掉 proof. 你仔细观察最左边的 branch, 这里 是可以用 *init*<sub>1</sub> 将其 close 掉, 因为其中 variables assign 都是 unified. 这里必有 n=3, 可  $f_1$  和  $f_2$  还 是确定不了,但是依然可以减少它们 searching space,即  $f_1=x, f_2=5-x$ ,那么最右边 branch 也 因此被 close 了. 此时最上面两个 branches 就变成了

$$\Gamma$$
:  $\rightarrow fib(4, x)$  and  $\Gamma$ :  $\rightarrow fib(3, 5 - x)$  iter-con

它们和我们 end-sequent 是非常像的,我们可以用前面的步骤分别在对它们再做一次 derivation,对于 fib(4,x), 利用 iter-con 显然我们可以得到

$$\Gamma$$
;  $\cdot \to fib(3,y)$  and  $\Gamma$ ;  $\cdot \to fib(2,x-y)$ 

对于 fib(3,5-x) 同理有

$$\Gamma$$
;  $\cdot \to fib(2, z)$  and  $\Gamma$ ;  $\cdot \to fib(1, 5 - x - z)$ 

可以看到直到 fib(1,0) 或者 fib(0,0) 才会停止. 这背后本质就是如果我要计算第 5 个 Fabonacci number, 那么我得先计算第 4 个 Fabonacci number 和第 3 个 Fabonacci number.

2. 如果atoms are positive, 那么最终只能用  $init_r$  来 close 掉 proof. 那么此时我们是可以 focus 最上面 两个 branch 的 right side atom, 这两个 atom 里面的 variables 也都是 unified, 同时我们可以再利用  $init_r$  来 close 掉这两个 branch,此时得到 n=0,  $f_1=1$ ,  $f_2=0$ . 此时只剩下了最右边的 branch,即

$$\Gamma$$
;  $fib(2,1) \rightarrow fib(5,5)$ 

相比于 end-sequent, 我们多了一个 knowledge fib(2,1). 按照这种思路我们可以继续得到 fib(3,2), 依次往后类推.

Annotation 243 想象一下我们正常计算第 n+2 个 Fabonacci number 的思路,无非两种:(1) 先计算第 n+1 和第 n 个,它们之和就是第 n+2 个; (2) 从第 0 个开始计算起,依次往后计算  $1,2,3,\cdots$  直到 n+2 个. 它们正好就对应了 atoms are negative 和 atoms are positive 的情况. Prolog 实际上就应用了第一种思路,这种思路叫goal-oriented strategy.

在 Prolog world 里面我们的 query with head of clause and continue with the body as the new goal, 在 proof world 里面它就对应了 close the right branch after  $\supset L$  and continuing with the left. 这好像看起来在上面的例子中没那么显然,那是因为用了不正规的 Prolog,即 inlined arithmetical express,正常来说我们得这样写

$$fib(M, N) : -fib(X_1, Y_1), X_2 = X_1 + 1, fib(X_2, Y_2), M = X_1 + 2, N = Y_1 + Y_2$$

与思路 2 对应的就是前面我们提到的 forward chaining,在这种情况 left branch of  $\supset L$  must be closed 来产生新的 knowledge.

**Annotation 244** 前面例子里面有一个小细节就是,里面用的 variables 都是暗含了 universal quantifier. 这一点需要注意,同时 unification 是具有传递过程的,比如在某个地方确定了某个 variable 的值,那么在它前面的,也就是从 shape of proof 向下含有 x 的地方,也要具有相同的值.

# 5.5 Foward Chaining

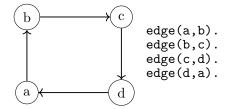

Definition 245 The state that no new facts can be generated from the sef of known facts is called saturation.

Example 246 假设我们下面的一个小 program snippet:

```
path(X,Y) :- edge(X,Y).
path(X,Z) :- edge(X,Z), path(Z,Y).
```

cycle :- path(X,X).

同时给定一个 graph:

那么一个正常的 forward chaining engine 就会根据上面的 logic program 产生新关于 path 的 knowledges, 后续以此产生 cycle.

Definition 247 The set of known facts is called database.

Annotation 248 有两个比较在 forward chaining 里面比较重要的概念:

- Facts are always ground atoms, meaning that there no free variable lingering around. 因为在 forward logic programming 里面 head 里面出现的变量一定都是在 body 里面的, 因此这样你新产生的 fact 也是不带 free variables 的.
- The database is considered as a set, so there is no duplication of facts in it.

Example 249 接下来我们看一个有趣的应用,我们可以把 forward chaining 应用到 programming language 的 parser 上. 以 context-free grammar 为例,一个 context-free grammar 可以表示为一个 tuple  $G = (V, \Sigma, \mathcal{P}, S)$ ,其中 V 表示各种 non-terminal symbols 集合, $\Sigma$  表示各种 terminators, $\mathcal{P}$  表示各种 production rules of the form  $X \Rightarrow \gamma(X \in V)$  and  $\gamma$  is a string with other non-terminal symbols or terminator),最后 S 表示 start symbol.

对于一个只包含 terminator 的 string w,它在 G 中一个 derivation 可以表示为  $S \Rightarrow \gamma_1 \cdots \Rightarrow \gamma_n \Rightarrow w$ ,其中每一步可以看做从  $\gamma_i$  中挑一个 non-terminal symbol X 出来,和 X 对应的一个 production rule  $X \Rightarrow \alpha$ ,将  $\gamma_i$  里面所有 X 出现的地方都换成  $\alpha$ ,那么就得到了  $\gamma_{i+1}$ . 有一个很自然的问题就是如何把这样的 derivation 写成 proof 的形式呢?

首先我们得构造类似的 inference rules, 我们用  $\gamma \Rightarrow w$  表示 w 可以由  $\gamma$  推导得来. 这里给分别给出三种 inference rules:

$$\frac{\gamma_1 \Rightarrow^* w_1 \quad \gamma_2 \Rightarrow^* w_2}{\gamma_1 \gamma_2 \Rightarrow^* w_1 w_2} \quad conc \qquad \frac{\alpha \Rightarrow^* a}{a \Rightarrow^* a} \quad id \qquad \frac{\gamma \Rightarrow^* w}{X \Rightarrow^* w} \quad (r)X \Rightarrow \gamma$$

其中 a 是 terminator. Rule conc 提供了 split string 的方法, rule id 适配 terminator, 最后 rule (r) 实际上一 组 rules,对应每一个 production rules 生成.

例如我们给定一个 context-free grammar:

$$T \Rightarrow -T \qquad [neg]$$
 
$$\mid T + T \quad [plus]$$
 
$$\mid (T) \quad [pars]$$
 
$$\mid var \quad [var]$$
 
$$\mid 1 \quad [one]$$
 
$$\mid 0 \quad [zero]$$

我们来看一下关于 -(x+1) 的 derivation, 即我们要找到关于  $T \Rightarrow^* -(x+1)$  的 proof, 这里的 S 就是 T.

关于 
$$-(x+1)$$
 的 derivation,即我们要找到关于  $T\Rightarrow^*-(x+1)$  的 proof,这里的 
$$\frac{\frac{x\Rightarrow^*x}{T\Rightarrow^*x} id}{\frac{T\Rightarrow^*x}{T\Rightarrow^*x} var} \frac{\frac{1\Rightarrow^*1}{T\Rightarrow^*x} one}{\frac{+T+T\Rightarrow^*x+1}{T\Rightarrow^*x+1} plus} \frac{one}{(\Rightarrow^*)} id$$

$$\frac{(\Rightarrow^*) id}{\frac{(\Rightarrow^*) (x+1)}{T\Rightarrow^*(x+1)} pairs} conc$$

$$\frac{(T)\Rightarrow^*(x+1)}{T\Rightarrow^*(x+1)} pairs$$

$$\frac{-T\Rightarrow^*-(x+1)}{T\Rightarrow^*-(x+1)} neg$$

你应该可以隐约的感受到如何选择 substring 应用 conc 是关键中的关键的.

接下来我们可以想想如何应用 forward chaining 呢? 首先我们要给出一些 basic facts, 那么它们应该是什么 呢?同时我们应当如何利用这些 basic facts 生成更多我们感兴趣的 facts 呢?你要知道利用上述 gammar 是可 以生成 infinite string matched that gammar. 如果我们想要 query  $T \Rightarrow^* w_0$ , 这里的做法是

- 1. 把  $w_0$  中的 terminator 作为 basic facts( $a \Rightarrow^* a$  for every terminator a in  $w_0$ )
- 2. 我们只 apply 满足下述条件  $\gamma \Rightarrow w$  ( $\gamma$  is head and w is body):
  - (a)  $\gamma$  is the substring of the right-side of gammar rules (i.e., terminator, T, T + T, -T and (T))
  - (b) w is the substring of  $w_0$

第一个条件是为了避免我们生成语法之外的 gammer snippets; 第二个条件显然是为了 goal-orient. 你可能会想只要第二个不行吗? 肯定是不行的,因为从  $w_0$  里面取的 substring 可能并不符合 gammar,例如你从 -(x+1) 取  $-(\Rightarrow^* -($ , 你对它只能继续 apply conc, 但是这没有任何意义,你后续可能无法 apply (r) rules 把 left side 变成 T, 我们的目标是  $T \Rightarrow^* w_0$ . 使用这种方法对 -(x+1) 做 forward chaining 为

1	_	$\Rightarrow^*$	_	
2	(	$\Rightarrow^*$	(	
3	x	$\Rightarrow^*$	x	
4	+	$\Rightarrow^*$	+	
5	1	$\Rightarrow^*$	1	
6	)	$\Rightarrow^*$	)	
7	T	$\Rightarrow^*$	1	one(5)
_	_			( - )
8	T	$\Rightarrow^*$	x	var(3)
$\frac{8}{9}$	T $T+T$	$\Rightarrow^* \\ \Rightarrow^*$		$\frac{var(3)}{conc(7,8)}$
		-	x+1	
9	T+T	⇒*	x+1 $x+1$	conc(7,8)
9 10	T+T $T$	⇒* ⇒*	x+1 $x+1$ $(x+1)$	conc(7,8) $plus(9)$
9 10 11	T + T $T$ $(T)$ $T$	⇒* ⇒* ⇒* ⇒* ⇒*	x+1 $x+1$ $(x+1)$	$conc(7,8)$ $plus(9)$ $conc \times 2(2,10,6)$ $pars(11)$
9 10 11 12	T + T $T$ $(T)$ $T$	⇒* ⇒* ⇒* ⇒* ⇒*	x + 1 $x + 1$ $(x + 1)$ $(x + 1)$	$conc(7,8)$ $plus(9)$ $conc \times 2(2,10,6)$ $pars(11)$ $conc(1,12)$

你发现这种手法和我们常见的 programming language 前端的 lexer 和 parser 非常的像, lexer 拿到 token 交给 parser, parser 尝试生成的 abstract syntax, amazing!

最后想一个问题为什么在最前面我们已经推出了一个 backward chaining 的方法, 还会想把 forward chaining 应用到 parser 上呢?这是一个好问题,当然是复杂度啊! forward chaining method 会更加的 cheap. 我们来分别计算一下不同方法下的复杂度,首先给定一个一般地  $S \Rightarrow^* w$ ,其中 |w| = n.

其中 backward chaining 的复杂度,你观察它的 derivation 实际上近似一个 full binary tree,其叶子树就是 terminators 的个数 n,这样一棵 tree 那么就有  $2^n-1$  个结点. 同时这样 n 个叶子结点的 full binary tree 可能会有很多种,这是因为 apply conc 产生的结果,这样 full binary tree 一共有  $\frac{2n!}{(n+1)!n!}$  种. 这样我们可以考虑 worst-case,即尝试了所有的 split 思路最后还是失败了,那么这样就产生了所有 full binary tree 都会涉及到.

最后来看看 forward chaining 的复杂度,它的复杂度取决于 saturated database 中的 facts 的个数,以及在 searching 过程中 apply rules 的个数. 首先来看 saturated database 中的 facts 的个数: 每个 fact 形如  $\gamma \Rightarrow^* w'$  满足  $\gamma$  is substring of the right side of grammer rules and w' is the substring of w, 设当前 context-free gammar 里面 longest right side of all grammar rules 的长度为 k. 同时 w 有  $\frac{(1+n)(n)}{2}$  个 substring,简单想一下这是

显然的,同理某个 right side of gammar rule 也最多有  $\frac{(1+k)(k)}{2}$  个 substring,这里感觉还要考虑一下有多少个 production rule,我们设为 m. 那么最多就有  $m \cdot \frac{(1+n)(n)}{2} \cdot \frac{(1+k)(k)}{2} \in O(mk^2n^2)$  个 facts. 任意地一个 facts,我们 可以对其 apply conc 或者 (r). 对于 (r) rules 它只有一个 premise,因此我们最多 apply  $O(mk^2n^2)$  次,而对于 conc rule 有两个 premise,但是这里是有限制是,因为  $\gamma_1\gamma_2$  必须还是一个 substring of the right side of gammar rules,同时  $w_1w_2$  也是 substring of w,因此当  $\gamma_1 \Rightarrow^* w_1$  确定之后, $\gamma_2 \Rightarrow^* w_2$  最多只有 O(kn) 个选择,那么最多可以 apply  $O(mk^3n^3)$  次.而 m 和 k 都是 finite 的,因此最终为  $O(n^3)$ .

当然还有办法优化,如果 k 比较大,可以将我们 context-free gammar 转化成 Chomsky normal form:

 $X \Rightarrow YZ$  or  $X \Rightarrow a$ .

这样 k 就被严格限制为 2.

### 5.6 Uniform Proofs

**Definition 250** A uniform proof is a proof in which each occurrence of a sequent  $\Gamma \to C$ , where C is a composed formula, is the conclusion of a rule introduing C's topmost connective.

Annotation 251 一个 uniform proof 就是尽可能先地 decompose right formula, 即 apply right rule, 或者换句 话来说它只对 right invertible rules 感兴趣 i.e. the negative and neutral ones.

**Definition 252** An abstract logic programming language is a logic in which every provable sequent  $\Gamma \to C$  has a uniform proof.

**Annotation 253** 这里可以解释为什么没有类似  $\vee$  的 connectives 出现在 logic programming 里面,因为  $\vee$  是 positive 的. 这里还缺点解释 todo.

Annotation 254 关于 unification algorithm 实际上我们已经在 type checking 什么的时候见识过了,这里概念上没什么区别. 但是这里我们会将其变成 inference rule 的形式,最终构建一个完整的 deductive system.

**Definition 255** we use the notation t = s to denote the judgment t and s are unifiable.

**Definition 256** Given two substitutions  $\sigma_1$  and  $\sigma_2$ , we define their composition as follow:

$$\sigma_1 \sigma_2 = \sigma_2 \circ \sigma_1$$

**Lemma 257** (uniqueness of most general unifier) If  $\sigma_1$  and  $\sigma_2$  are both the most general unifier, then  $\sigma_2$  is essentially a variable renaming of  $\sigma_1$ .

PROOF 这里我们将 most general unifier 简写成 mgu, 根据 mgu 的 definition, 我们知道分别存在 δ<sub>1</sub> 和 δ<sub>2</sub> 使得

$$\sigma_1 = \sigma_2 \delta_1$$
$$\sigma_2 = \sigma_1 \delta_2$$

于是  $\sigma_1 = (\sigma_1 \delta_2) \delta_1$ ,这意味着  $\delta_2$  改变的东西,都被  $\delta_1$  还原了. 并且  $\delta_2$  就只能改变做一些 variables maps to variables 的转换,是不能将 variables map to constants,因为  $\delta_2$  是没法还原 constants map to variables. 同理  $\sigma_2 = (\sigma_2 \delta_2) \delta_1$ ,其实  $\delta_1$  和  $\delta_2$  互为 inverse.

**Definition 258** we define jugement t and s are unifiable under most general unifier  $\sigma$  as

$$t \doteq s \mid \sigma$$

**Definition 259** We define unification calculus as follow

$$\frac{x \notin FV(t)}{x \doteq x \mid \{\}} \qquad \frac{x \notin FV(t)}{x \doteq t \mid \{x \to t\}} \qquad \frac{t = f(\bar{t}) \quad x \notin FV(t)}{t \doteq x \mid \{x \to t\}}$$

$$\frac{\bar{t} \doteq \bar{s} \mid \sigma}{f(\bar{t}) \doteq f(\bar{s}) \mid \sigma} \qquad \frac{t = f(\bar{t}) \quad x \notin FV(t)}{t \doteq x \mid \{x \to t\}}$$

$$\frac{t \doteq s \mid \sigma_1 \quad \bar{t}\sigma_1 \doteq \bar{s}\sigma_1 \mid \sigma_2}{(t, \bar{t}) \doteq (s, \bar{s}) \mid \sigma_1\sigma_2}$$

where x is a variable, t is a term,  $\bar{t}$  and  $\bar{s}$  are sequence of terms, (·) is empty sequence of terms, is empty substitution, f is function, and  $\bar{t}\sigma_1 = \sigma_1(\bar{t})$ .

**Theorem 260** (soundness) If  $t \doteq s \mid \sigma$  then  $t\sigma = s\sigma$ .

**Theorem 261** (completeness) If  $t\sigma' = s\sigma'$ , then  $t \doteq s \mid \sigma$  and  $\sigma' = \sigma\delta$ .

PROOF completeness 的证明咋一想还是不是那么显然,这里记录一下. 还是使用 induction hypothesis,但是这里要对  $t\sigma'$  做 induction,而不是 t,后面我们会看到为什么.

- Base cases:
  - $-t\sigma'$  is a variable.

那么这种情况下 t 也只能是 variable x, 并且  $\sigma'$  只能是  $\{x \to z\}$ , 其中 z 也是 variable. 考虑 assumption  $t \doteq s$ , 设 s = y, 那么这里的  $\sigma' = \{x \to z, y \to z\}$ . 根据 unification calculus, 若 x = y 则  $\sigma = \{\}$ , 那  $\Delta \sigma' = \sigma\{x \to z\}$ ; 若  $x \neq y$ , 则  $\sigma = \{x \to y\}$ , 那么  $\sigma' = \sigma\{y \to z\}$ .

 $-t\sigma'$  is a empty sequence.

那么这种情况下 t 也只能是一个 emptys equence, 此时  $\sigma'$  为任意的 substitution, 同理 s 也只能是一个 empty sequence. 此时  $\sigma = \{\}$ , 因此  $\sigma' = \sigma \sigma'$ .

- INDUCTION HYPOTHESES: 这里有两个 induction hypotheses:
  - 1. If  $t\sigma' = s\sigma'$ , then  $t \doteq s \mid \sigma$  and  $\sigma' = \sigma\delta$ .
  - 2. If  $\bar{t}\sigma' = \bar{s}\sigma'$ , then  $t \doteq s \mid \sigma$  and  $\sigma' = \sigma\delta$ .
- Inductive steps:
  - $-t\sigma'$  is a term r that is not a variable. 这里我们分析 t 可能的结构

Case 1 
$$t = x$$

Subcase 1 s = y

$$x\sigma' = y\sigma'$$
 assumption 
$$\sigma' = \{x \to r, y \to r\}$$
 by defintion of substitution 
$$t \doteq s \mid \{x \to y\}$$
 by unification calculus(这里实际还需要 cover 一下  $x = y$  的情况) 
$$\sigma' = \{x \to y\}\{y \to r\}$$
 substitution composition

Subcase 2  $s = f(\overline{s})$ 

$$\begin{split} x\sigma' &= f(\overline{s})\sigma' & \text{assumption} \\ \sigma' &= \{x \to f(\overline{s})\sigma'\} \cup \sigma_1' & \text{def of sub and } \sigma_1' \text{ is } \sigma/x \\ x \not\in FV(f(\overline{s})) & \text{otherwise unifiable} \\ \sigma' &= \{x \to f(\overline{s})\sigma_1'\} \cup \sigma_1' & f(\overline{s})\sigma' = f(\overline{s})\sigma_1' \\ \sigma' &= \{x \to f(\overline{s})\}\sigma_1' & \text{def of sub comp} \end{split}$$

Case 2  $t = f(\overline{t})$ 

Subcase 1 s = y same as subcase 1.2.

Subcase 2 
$$s = f(\overline{s})$$

$$f(\overline{t})\sigma' = f(\overline{s})\sigma'$$
 assumption 
$$\overline{t}\sigma' = \overline{s}\sigma' \qquad \text{def of sub}$$
 
$$\sigma' = \sigma\delta \qquad \overline{t}\sigma' \text{ 在规模上严格小于 } f(\overline{t})\sigma', \text{ 因此这里可以用 IH 2}$$
 
$$\overline{t} \doteq \overline{s} \mid \sigma \qquad \text{by unification calculus}$$
 
$$f(\overline{t}) \doteq f(\overline{s}) \mid \sigma \qquad \text{by unification calculus}$$
 
$$\sigma' = \sigma\delta \qquad \text{final}$$

 $-t\sigma'$  is non-empty sequence of terms.

Case 1 
$$t = (t_1, \bar{t}_2)$$

Subcase 1  $s = (s_1, \overline{s}_2)$ 

$$(t_1, \overline{t}_2)\sigma' = (s_1, \overline{s}_2)\sigma' \qquad \text{assumption}$$

$$(t_1\sigma', \overline{t}_2\sigma') = (s_1\sigma', \overline{s}_2\sigma') \qquad \text{def of sub}$$

$$t_1 \doteq s_1 \mid \sigma \text{ and } \sigma' = \sigma\delta_1 \qquad |t_1\sigma'| < |t\sigma'| \text{ IH 1}$$

$$\overline{t}_2(\sigma\delta_1) = \overline{s}_2(\sigma\delta_1) \qquad \text{def of sub}$$

$$(\overline{t}_2\sigma)\delta_1 = (\overline{s}_2\sigma)\delta_1 \qquad \text{comp of sub}$$

$$\overline{t}_2\sigma \doteq \overline{s}_2\sigma \mid \sigma_2 \text{ and } \delta_1 = \sigma_2\delta_2 \qquad |(\overline{t}_2\sigma)\delta_1| < |t\sigma'| \text{ IH 2}$$

$$\sigma' = \sigma\sigma_2\delta_2 \qquad \text{def of sub}$$

如果这里我们不是对  $t\sigma'$  做 induction, 而是对 t 做 induction, 那么这里的 induction hypothesis 就变成了  $[\bar{t}_2\sigma]$ , 但是这里我们是无法确保它是严格小于 |t| 的.

### 5.7 Resolution

Remark 262 这章的目的是证明某个 classical first-logical formula F is unsatisfiable.

**Definition 263** The proof of a formula's unsatifiability is called a refutation.

**Annotation 264** (formula transformations) 任意一个 F 它的结构可能是多种多样的,我们肯定首先要 format it. 拿个一个 F 我们经历这样的几个过程:

- 1. 首先把所有的 quantifier 提到最前面 (总是可以做到的),得到 prenex form  $F = \cdots \exists .x_1 \cdots \forall y_i \cdots F'(\cdots, x_1, \cdots, y_i, \cdots)$  其中  $F'(\cdots, x_1, \cdots, y_i, \cdots)$  是 quantifier-free 的.
- 2. 再把  $F'(\dots, x_1, \dots, y_i, \dots)$  里面所有的 ¬ 放到 atoms(也总是可以做到的),得到对应的 negation form  $F''(\dots, x_1, \dots, y_i, \dots)$ .
- 3. 接着把  $F''(\dots, x_1, \dots, y_i, \dots)$  变成 CNF 形式,得到  $F'''(\dots, x_1, \dots, y_i, \dots)$
- 4. 最后去掉所有的  $\exists$ ,得到对应的 skolemization  $F = \cdots \forall y_i \cdots F'''(\cdots, f(y_i, \cdots, y_m), \cdots, y_i, \cdots)$

最后我们 generalize 一下

$$F = \forall x_1 \cdots \forall x_n (L_{11} \vee \cdots \vee L_{1n_1}) \wedge \cdots \wedge (L_{k1} \vee \cdots \vee L_{kn_k}).$$

对应的  $\neq F$  为

$$\neg F = \neg(\forall x_1 \dots \forall x_n . (L_{11} \vee \dots \vee L_{1n_1}) \wedge \dots \wedge (L_{k1} \vee \dots \vee L_{kn_k}))$$

$$\equiv \exists x_1 \dots \exists x_n . \neg((L_{11} \vee \dots \vee L_{1n_1}) \wedge \dots \wedge (L_{k1} \vee \dots \vee L_{kn_k}))$$
(1)

**Theorem 265** (Herbrand's theorem) Given a formula  $\exists x_1 \dots \exists x_n . F(x_1, \dots, x_n)$ , where F is quantifier-free, is valid if and only if there exists a finite set of term  $t_{ij}, 1 \le i \le k$  and  $1 \le j \le n$  such that the disjunction:

$$F(t_{11},\cdots,t_{1n})\vee\cdots\vee F(t_{1k},\cdots,t_{nk})$$

is valid.

Annotation 266 Hthe 最关键的作用就是把 first-order logic 转换到 propositional logic. 证明的 Hthe 的 sketch:

1. 首先把它放到 cut-free sequent calculus 里面,根据 cfsc 的 completeness 得到一个 proof(稍显不那么 formal,因为没有 sequent calculus 里面带 ⊢vaild 形式):

$$\frac{\exists x_1.\cdots \exists x_{n-1}.F(x_1,\cdots,x_{n-1},t'_n)}{\exists x_1.\cdots \exists x_n.F(x_1,\cdots,x_n)} R \exists \frac{\exists x_1.\cdots \exists x_{n-1}.F(x_1,\cdots,x_{n-1},t''_n)}{\exists x_1.\cdots \exists x_n.F(x_1,\cdots,x_n)} R \exists \frac{\exists x_1.\cdots \exists x_n.F(x_1,\cdots,x_n)}{\exists x_1.\cdots \exists x_n.F(x_1,\cdots,x_n)} contraction$$

2. 下一步就是从上往下把 existential quantifier, 即去掉 R∃ rule, 直接把 primise 换成 conclusion, 相当于就是一个 *id* rule. 这里你会发现有些关于 existential quantifier 的 *contraction* rules 也是用不了, 因此也要去掉. 最终我们就得到了 Hthe 的结论.

**Annotation 267** (from  $\neg F$  back to F) 这里设  $C_i$  表示  $(L_{i1} \lor \cdots \lor L_{in_i})$ , 对  $(1) \neg F$  可以 apply Hthe 得到  $\neg F$  is vaild iff

$$\neg (C_i \land \cdots \land C_k)[\overline{t}_1/\overline{x}] \lor \cdots \lor \neg (C_i \land \cdots \land C_k)[\overline{t}_m/\overline{x}]$$

is vaild for a finite sequence of term sequences  $\bar{t}_1, \dots, \bar{t}_m$ . 比较 trick 是我们需要把它再转回来,证明 ¬¬F is unsat,此时

$$\neg \left( \neg (C_i \wedge \dots \wedge C_k)[\overline{t}_1/\overline{x}] \vee \dots \vee \neg (C_i \wedge \dots \wedge C_k)[\overline{t}_m/\overline{x}] \right) 
\equiv \left( (C_i \wedge \dots \wedge C_k)[\overline{t}_1/\overline{x}] \wedge \dots \wedge (C_i \wedge \dots \wedge C_k)[\overline{t}_m/\overline{x}] \right)$$
(2)

Definition 268 (Davis-Putnam method)

### Algorithm 1: Davis-Putnam method

```
1 begin
          F \leftarrow \forall \overline{x}.F'(\overline{x}) \quad \triangleright F' \text{ is CNF and } \overline{x} = (x_1, \cdots, x_n)
 2
          terms \to [\bar{t}_1, \bar{t}_2, \cdots] \quad \triangleright \ terms is an infinite stream of sequences of terms used for \bar{x}
 3
           in lexicographic order
         i \leftarrow 1
 4
         G \leftarrow F'[\overline{t}_i/\overline{x}]
 5
          G \leftarrow simplify(G)

ho empty clause means that C_i was evaluated to false
          while G does not contain an empty clause do
 7
 8
               i \leftarrow i + 1
               G' \leftarrow F'[\overline{t}_i/\overline{x}]
 9
              G \leftarrow G \wedge G'
10
               G \leftarrow simplify(G)
11
```

The *simplify* method applies the following simplications to the formula:

#### • Rule for elimination of single-literal clause

1. If G contains a clause  $\{p\}$  and other clause  $\{\overline{p}\}$ , then we are done. They cannot both be true at same time, so the formula is unsatisfiable.

- 2. If G contains a clause  $\{p\}$ , we can give a interpretation makes p is false then G is false, but G needs to be false for every interpretation, thats is not a problem. If given p is true under some interpretations, in the case, we can remove the clause  $\{p\}$ , every clause that contains p (a disjunction with a true literal is true), and remove  $\overline{p}$  from every clause that contains it ( $\overline{p}$  is the negation of p, that is a false literal in a disjunction is good for nothing).
- 3. If G contains a clause  $\{\overline{p}\}\$ , its similar as the case  $\{p\}\$ .

#### • Affirmative-Negative rule

If p occurs only positively or only negatively in G, then we can delete all clauses containing p without loosing unsatisfiability.

#### Rule for eliminating atomic formulas

If G contains a clause  $\{p\} \cup C_i$  and another clause  $\{\overline{p}\} \cup C_j$ , then we can replace both of them by the clause  $C_i \cup C_j$ .

#### Annotation 269 关于 DPM 的解释:

- 为什么  $G = G \wedge G'$ ? 主要这里的 F 是限定在 unversal quantifers 下的,如果 F 想要在 unsat,那么对于 任意的 substitution instances 在任意的 interpretations 下都应该是 unsat. 同时根据 Hthe,我们知道 F is unsat 当且仅当存在 conjunction of finite substitution instantces is unsat. 这样当 F is unsat 的时候,能保证我们 process 可以停止,如果 F is not unsat,那么这个过程会一直运行下去.
- simplify 详解: simplify 本质就是在不影响原公式 unsatisfiable 的情况下,尽可能的简化 current formula,即the resulting formula is unsat iff the original formula is. 同时 DPM 的最重要的思想就是如果你想证明一串 conjunction  $C_1 \wedge C_n$  is unsat, 你只要去保证其中一个 conjunct  $C_1$  is always false 就行了,换句话说我们将忽略某些其他的 conjuncts.
  - 1. 对于 single-literal clause 的讲解已经比较清楚: 如果存在  $\{p\}$  和  $\{\bar{p}\}$  冲突,这种情况很容易想明白;而对于没有冲突的  $\{p\}$ ,因为总存在使得 p is true 的 interpretation,那么有 p 存在的 clauses 也都是 true 在这种情况下 F 整体是否为 false 与它们没有关系,因此去掉它们并不会影响 F is unsatifiable. 注意此时  $\bar{p}$  is false,对于它所在的 clause 是否 false 和它也没有关系,除非这个 clause 只含有  $\bar{p}$ ,那又回到第一种情况了,因此可以去掉这样的  $\bar{p}$ . 其余使得 p is false 的 interpretations,直接就让 F 变成 false,因此这种情况不用考虑了。仔细体会其中的奥义,我们在渐渐的逼近那个 always false 的 clause,prune 掉所有不会影响 F is unsat 的 clause. 在这种情况下它们与 F 整体是否为 false 与 p 没有关系.
  - 2. 例如假设只有 p 存在 (没有  $\neg p$  存在), 因为总存在使得 p is true 的 interpretations, 使得 p 所在 clauses 也是都是 true, 在这种情况下整体 F 是否为 false, 实际上与它没有关系. 同理只存在  $\neg p$  的情况也是一样的.

- 3. 这里的  $\cup$  应该是  $\vee$ , 当 p is true, the conjunction of clause is false 取决于  $C_j$ ; 当  $\overline{p}$  is false, the conjunction clause is false 取决于  $C_j$ . 因此最终 the conjunction of clause is unsat, 取决于  $C_i \vee C_j$  is unsat, 这些你需要回顾一下 connective 对 sat 的影响.
- 为什么 while 的循环条件是不包含 *empty clause*? 从 simplify methods 中你可以看到 clauses and literals those not affect unsat will be removed,显然出现 empty clause 就是已经 unsat 了.

作为 SAT slover 基础的 DPPLL algorithm 就是 refined from DPM.
